REQUEST FOR PROPOSAL

The **Governor of Guam, Lourdes A. Leon Guerrero, and Lt. Governor Joshua F. Tenorio**, through the **Director of the Department of Public Works (DPW),** invite sealed proposals for the **New Simon Sanchez High School – Finance, Demolition, Design, Build, Lease/Leaseback, and Insure/Capital Maintenance (FDDBLM), Project No. 730-5-1059-L-YIG.**

RFP documents will be available starting **Friday, March 28, 2025**, at the **Contract Administration Technical Services Office, Ground Floor, TMC Building, DPW** for a **non-refundable fee of $25.00**. Payment must be made at the **Treasurer of Guam,** located at DPW, and a receipt must be presented to obtain the documents. Upon obtaining the RFP, Proposers must complete and return the **Acknowledgment of Receipt Form (Attachment 7)** to DPW. Failure to submit this form will result in the Proposer's disqualification as being non-responsive.

A **mandatory <u>in-person</u> pre-proposal conference** will be held on **Friday, April 4, 2025, at 9:00 a.m.** in the **Guam Economic Development Authority (GEDA) Conference Room, located on the 5th floor of the ITC Building.** A **mandatory site visit** will follow at 2 p.m. at the old Simon Sanchez High School to allow Proposers to familiarize themselves with the project site.

Sealed proposals must be submitted to the **Contracts Administration and Technical Services Section, Division of Capital Improvement Projects, Ground Floor, TMC Building, DPW** by **4:00 p.m., Friday, May 23, 2025**. Proposals will not be accepted without proof of payment.

DPW affirms that all minority business enterprises will have full opportunity to submit proposals and will not be discriminated against based on race, color, or national origin in consideration for an award. The Government of Guam reserves the right to reject any or all proposals and waive any irregularities in the best interest of the government.

VINCENT P. ARRIOLA
Director

I. PROJECT OVERVIEW

The Governor of Guam, through the Department of Public Works (DPW) and with the assistance of the Guam Economic Development Authority (GEDA), issues this Request for Proposal (RFP) for the financing, demolition, design, build, lease/leaseback, and insure/capital maintenance ("FDDBLM") of a new Simon Sanchez High School in Yigo.

The Government of Guam (the "Lessee"), acting through DPW, seeks to procure the new facility through a municipal lease/leaseback arrangement in compliance with the ***MA KÅHAT ACT OF 2013,*** Public Law 37-22*,* and all applicable public laws, including but not limited to Public Law 20-27, Chapter 8, Title 1 of the Guam Code Annotated, relating to Arts in Public Buildings and Facilities.

Under this RFP, the Government of Guam is authorized to lease school property to the successful Proposer to facilitate project financing, demolition, design, construction, FF&E services, and insurance and maintenance services. Upon completion, the Government of Guam will lease back the facility for a mutually agreed term necessary to amortize the associated costs. The leaseback period shall not exceed 30 years from the scheduled completion date. It may be an annually renewable lease with automatic renewal provisions contingent on available pledged or reserved revenue under §58D109 of Chapter 58 of Title 5 Guam Code Annotated. The leaseback shall not be considered "public indebtedness" under 48 U.S.C. § 1432a, §11 of the Organic Act of Guam, or Guam law. Any lease term extensions will be subject to and not exceed the statutory limit under Guam law.

Proposals must comply with all Government of Guam requirements outlined in this RFP and, where silent, Guam Procurement Law, Rules, and Regulations. The RFP details the required scope of services and proposal submission instructions.

Eligible Proposers include developers, contractors, and finance companies legally operating under U.S. state or territorial laws and subject to Guam licensing regulations. Information on licensing is available from the Director of Revenue and Taxation. Special-purpose company proposals may also be considered.

The successful Proposer will serve as the primary lessor of the new Simon Sanchez High School and must submit all required proposal documents within the timelines specified in this RFP.

II. TERM AND TIME OF PERFORMANCE

The term of this solicitation is comprised of two sections: 1) Financing and Construction not to exceed seven-hundred and thirty (730) days from the issuance of Notice to Proceed, and 2) The negotiated Lease/Leaseback Capital Maintenance period not to exceed thirty (30) years.

III. SCOPE OF SERVICES

The Proposer shall be responsible for the scope of work, services and responsibilities in this RFP and the requirements outlined in the Financing Scope of Work (Attachment A) and the Design/Construction and Insurance/Capital Maintenance Scope of Work (Attachment B).

IV. COMMUNICATION REGARDING THE RFP

Any correspondence or communication by a potential Proposer must be made in writing via email addressed to the sole point of contact John F. Calanayan, Engineer Supervisor at john.calanayan@dpw.guam.gov or by hand delivery at the Contract Administration Technical Services Office, Ground Floor, TMC Building. All written communications must reference: **NEW SIMON SANCHEZ HIGH SCHOOL: FDDBLM Project No. 730-5-1059-L-YIG** in the subject or reference line.

V. PROPOSAL PACKAGE REQUIREMENTS

Each Proposal Package will consist of the Proposer's Submittal with all the required forms/addenda, complete with original signatures and notarizations where necessary. The Proposal Package will also contain a **separate and sealed envelope** marked **"Term Sheet and Price Proposal"** for negotiations.

VI. PROPOSAL SUBMITTAL

The Proposal shall be submitted in a sealed envelope or box that is clearly marked **"NEW SIMON SANCHEZ HIGH SCHOOL FDDBLM Project No. 730-5-1059-L-YIG".** It must include one (1) original with all the required forms listed in Section XXXI- RFP ATTACHMENTS AND LEGAL REQUIREMENTS complete with original signatures and notarizations where necessary, six (6) copies, and two (2) electronic copies (CD or USB flash drive) containing the complete technical submittal and one (1) separate and sealed individual Term Sheet and an individual Price Proposal.

VII. INSTRUCTIONS FOR SUBMITTING A PROPOSAL

1. Format

Submission must be in 8.5 X 11-inch format with font no less than 12-point font size. Each submittal shall not contain more than forty (40) pages, excluding front and back covers, tabs, certificates of insurance, detailed schedule charts, and required forms. Attachments not part of the forty (40) pages should be tabbed and labeled accordingly.

Each RFP Packet shall include a description of the type, technical experience, background, qualifications, and expertise of the Proposer. The description shall show that the firm possesses the demonstrated skills and professional experience to perform the general functions of the Project and fulfill the government's goals and vision for the Project. Submittals shall describe in detail the Proposer's approach to the Project. Creative methodology, and/or technology that the Proposer uses or unique resources that the Proposer can offer to the Project is encouraged.

2. Contents

Respondents shall comply with the following requirements for its RFP Packet:

Section 1: Executive Summary (max. 1 page)-

This should be an overview of the entire RFP Packet with a description of the general approach and/or methodology they will use to meet the goals and fulfill the general functions set forth in the RFP.

Section 2: Table of Contents. Include clearly identifying the written material by section and page number.

Section 3: Cover Letter (max. 1 page)

Each proposal shall include a cover letter signed by a person within the firm authorized to make representations on behalf of the firm and to bind the firm. The cover letter shall include the following information:

a) The Proposer's contact person's name, phone number, and email address relative to the proposal.

b) The Proposer's principal place of business and the location of the office proposing/sponsoring the work relative to this proposal.

c) You must also indicate whether you are operating as an individual proprietorship, partnership, corporation, or joint venture.

d) A brief statement acknowledging the firm's understanding of the scope of work.

e) A positive commitment to perform the services described, with the personnel specified in the submission, **within the budgetary parameters of the "*MA KÅHAT ACT OF 2013" and any subsequent/relevant public laws*.**

f) An acknowledgement that all addenda were received (list each addendum number and date in the letter).

Section 4- Personnel Experience and Qualifications

a) A brief history of the Proposer. Please include any former names of the Proposer and the number of years the Proposer has participated in development or similar construction projects as a developer and/or general contractor under each name. List any reasons for change of name or corporate structure.

b) Identify the overall project coordinator or manager who will serve as the single point of contact and liaison between DPW's Construction Manager and the Proposer for all work under the contract. Explain why this person has been selected as the project coordinator/manager. The manager candidate may be subject to DPW approval.

c) Organizational Charts for Proposer. This shall include two (2) charts: 1. A chart of all corporate entities on the Proposers team, and 2. A chart of all key personnel, with their titles and specific task assignments for the Project.

d) Resumes of personnel involved with the Project shall be included, including their school construction experience. Include A&E personnel. The evaluation will consider the entire team. Therefore, no changes in the Proposer's composition will be allowed without written approval by DPW.

e) Provide a description of the Proposer's technical competence and ability to draw upon multi-disciplinary staff to address the services required under the RFP.

Section 5- Approach and Capacity of Proposer

Detailed description of the Proposer's plan, methods, and ability for carrying out the Project, including:

3. Construction and Insurance/Capital Maintenance

a) Provide a statement regarding the Proposer's availability and resources.

b) Location of nearest office and main office, if different.

c) The technical and managerial approach to the Proposer's partnership with the Government of Guam (DPW, GEDA, GDOE).

d) How the Proposer plans to ensure the project remains within the budgetary ceilings and parameters set by Guam law for Simon Sanchez High School, including strategies for cost control and efficient resource allocation.

e) How the Proposer plans to perform the required services with its resources and current workload; and how the Proposer plans to incorporate skilled and trained workforce into the Project. **Include a Critical Path Method (CPM) schedule and/or chart as an attachment to the proposal.**

f) How the Proposer plans to rapidly mobilize and execute an accelerated financing, demolition, design, and construction schedule to meet the project's expedited construction timeline. Describe any concurrent strategies to streamline mobilization, expedite demolition and accelerate project completion.

g) How the Proposer plans to incorporate design and construction innovations that enhance the expedited construction schedule and cost efficiency, ensuring the Government of Guam achieves the highest economic value throughout the design, construction, and insurance/capital maintenance period. Describe any innovative design approaches or technologies to help reduce operational costs for GDOE and the Government of Guam during the insurance and capital maintenance phase.

h) How the Proposer will incorporate **Attachment B** and the government's design references into the design and construction process **to ensure key stakeholder feedback is effectively integrated into the final build.**

i) How the Proposer intends to use resilient building materials and systems that will allow the Government of Guam to use the facility as an emergency shelter during a super-typhoon and quickly bring the facility back online after a storm.

j) How the Proposer plans to incorporate local subcontracting teams into the Project, if applicable.

k) How the Proposer plans to incorporate construction means, methods, and quality control into the Project.

l) Detailed discussion on costs related to fees, general conditions, insurance, supervision, and management of all portions of the scope of work.

m) Provide a statement of financial resources, bonding capacity and insurance coverage.

n) Certificates of Insurance identifying the firm's current insurance coverage.

o) Copy of the Contractor's License.

p) Provide name and license of Proposer's Architectural/Engineering Design Team.

q) Provide all required attachments in this RFP in an appendix not counted toward the forty (40) pages.

4. Financing

The Proposer shall work with the Guam Economic Development Authority (GEDA) to finance the new Simon Sanchez High School construction. Include the following information related to financing:

a) Proposer's proposed structure in detail, provisions for extension of maturity, roll-over, or any other similar occurrence.

b) Provide a sealed Term Sheet or similar format outlining the terms and conditions of the proposed lease/leaseback agreement.

c) Discuss the estimated timeline for the issuance of this lease/leaseback and describe your firm's ability to conduct this transaction in a timely. Please feel free to outline certain variables such as a credit committee, and their effects, if any, on the terms and conditions of the financing.

d) Please include your firm's latest audited financials for three (3) years.

e) Please describe any other terms and conditions your firm requires regarding this financing.

f) Indicate the principal personnel that would be available to GEDA and the government and describe their experience and responsibilities for this financing.

g) Ability of Proposer to offer suggestions on various arrangements for service and maintenance contracts in support of the upkeep and service of the leased facility. Please provide detail on suggested payment arrangements.

h) Ability of Proposer to allow the purchase of the leased school facility by Lessee at any time during the lease period. Please provide details on the pre-payment arrangement scenario.

Section 6- Experience on Similar Projects

Description of the Proposer's experience to the area of building public schools or similar construction in size, price, and scope. Please provide a list of completed or ongoing projects the Proposer has been involved with where the total project contracts are similar in size, price, and scope. Within that list:

a) Identify the method (e.g., leaseback, bid-build, etc.) by which each project was constructed. For leaseback projects, include the total cost of each project and the breakdown of the total cost by preconstruction services and construction services. Provide some examples of its experience in a municipal leaseback project.

b) Include a discussion of the Proposer's experience with projects performed adjacent to an occupied building and/or campus.

c) Discuss the Proposer's experience with projects performed in tropical environments.

d) Identify whether the project is completed or ongoing.

e) Identify if any of the projects had phased completion.

f) For the projects listed above, be sure to include the following information:
   i. Project name and Description.
   ii. Firm's role.
   iii. Award and completion dates.
   iv. Project initial contract price and final contract price.
   v. Construction cost.
   vi. Staffing, including Proposer's team members, subcontractors and consultants.
   vii. Relationships with Owner/Client during the project.
   viii. References- Provide the owner's contact name, telephone number, and email address.
   ix. Discussion of claims, demands, and/or litigation arising from the project and involving the Proposer, and the resolution.
   x. List projects that the Proposer has completed that had some or all of the following obstacles, including the creative solutions from the Proposer on how these obstacles were overcome: 1. A very aggressive schedule, 2. Significant budgetary Restrictions, 3. Be prepared to expand on what you did to accommodate the project's complexity; and the clients' needs, minimizing inconvenience; and maximizing safety.

Section 7- Performance Issues

Provide a claims statement for all resolved or ongoing claims. Submit a statement indicating any and all lawsuits or claims in which the Proposer or its personnel instigated a claim and/or litigation regarding construction projects within the past five (5) years and indicating any claims in which claims and/or litigation have been pursued against the Proposer or its personnel. For each listed claim and/or litigation

state the issues in the claim and/or litigation, the status of the claim/litigation, the names of the parties involved, and the outcome, if any.

The proposer's claims statements MUST include resolved and ongoing claims. Proposer's claims statement MUST include claims history of Proposer and its personnel, as well as Associated Firms. "Associated Firms" are businesses, corporations, companies, partnerships, or other entities associated with the Proposer and/or its personnel (e.g., firm name changes, association as previous owner, general partner, limited partner, or other officer).

The proposer must hold a Contractor's License, which is current, valid and in good standing with the Guam Contractor's Licensing Board. Include a copy of your contractor license and statement on whether the license has been revoked or suspended in the last five (5) years.

If any of the following have occurred, please describe in detail the circumstances of each occurrence.

a) Failure to enter into contract or professional services agreement once selected.

b) Withdrawal of a proposal or bid because of an error.

c) Termination or failure to complete a contract.

d) Debarment by any municipal, county, territory, state, federal state, federal, or local agency.

e) Involvement in litigation, arbitration, or mediation, whether concluded or ongoing.

f) Conviction of the Proposer or its principals in violating any territory, state, or federal antitrust laws by bid or proposal rigging, collusion, or restrictive competition between bidders or proposers, or conviction of any local, state or federal law related to bidding or performance of services.

g) Knowing concealment of a deficiency in the performance of a prior contract.

h) Falsifying information or submitting deceptive or fraudulent statements in connection with a contract.

i) Willful disregard for applicable rules, laws, or regulations.

j) Failure to disclose information regarding any of the above may indicate an unsatisfactory performance record. Information regarding any of the above may be considered in determining the suitability of Proposer to perform the services needed. Accordingly, the proposer may describe mitigating factors as a part of any of the above.

VIII. TERMS OF PAYMENT

1. The Government of Guam shall pay the Proposer on an annual basis for all lease payments due in accordance with the terms of the contract, consistent with the "MA KÅHAT ACT OF 2013" AND ANY SUBSEQUENT/RELEVANT PUBLIC LAWS.

2. All payments shall be made in accordance with, subject to, applicable provisions of §22505 of Chapter 22 of Title 5 of the Guam Code Annotated.
3. The Developer, Contractor or Finance Company shall submit one (1) annual invoice, in original form, for lease payments due. The Government of Guam shall have thirty (30) calendar days after receipt of the invoice to make payment.
4. Non-Appropriation Clause: In event that sufficient funds (a) are not appropriated by the I Liheslaturan Guahan prior to the beginning of any Renewal Term for the payment of the Base Rentals on the Base Rental Payment Dates and reasonably estimated Additional Rentals payable during such Renewal Term, or (b) are otherwise not legally available for such purpose, then an Event of Non-appropriation shall be deemed to have occurred. If an Event of Non-appropriation occurs, I Liheslaturan Guahan shall not be obligated to make payments of the Base Rentals and Additional Rentals provided for herein beyond the last day of the Renewal Term during which such Event of non-appropriation occurs, except for the Government of Guam's obligation to pay Rentals which are payable prior to the termination of the Lease.
5. If the Government fails to perform as lessee under the leaseback period or decides not to appropriate leaseback payments GDOE shall vacate the facility and the lessor may take possession of the Simon Sanchez High School, investors and/or the trustee will typically be permitted to operate the financed facility for a period of time specified in the ground lease. However, once the term of the ground lease expires, the Government of Guam is entitled to repossession of the site together with all improvements on the site, free and clear of any interest to the investors or a trustee on their behalf.
6. To expedite the construction schedule, the Government of Guam may issue 1) A separate Notice to Proceed for the Demolition and Clearing, covered by local funds, along with 2) the Notice of Award. The contractor must submit a separate invoice for Demolition and Clearing, which will be paid 30 days after receipt of invoice.

IX. AVAILABILITY

This Request for Proposals ("RFP") may be picked up at the Contract Administration Technical Services, Ground Floor, TMC Building, Department of Public Work, Monday through Friday, excluding holidays, between 8:00 a.m. and 5:00 p.m., beginning March 28, 2025. Upon obtaining this RFP, prospective Proposers must sign in in the Proposers Register in order toto receive any addenda or other notices related to this RFP. Failure by prospective Proposers to sign and register may result in the prospective Proposer not receiving notices or addenda from DPW regarding this RFP.

X. AMENDMENTS

DPW reserves all rights to revise or amend this RFP prior to the date set for opening proposals. Such revisions and amendments, if any, will be announced by an amendment or addenda to this RFP and shall be identified as such. Any amendment shall refer to the

portions of the RFP it amends. Amendments and addenda shall be sent to all prospective Proposers who have signed in the Proposers Register Form.

XI. PRE-PROPOSAL CONFERENCE

Pre-proposal conferences are *"Mandatory"* as stated on the RFP Timelines. The pre-proposal conference shall be attended by an in-person representative of the Proposer. It will be conducted only to explain the procurement requirements for this Request for Proposals. DPW will notify all Proposers in writing via an addendum to this RFP of any substantive clarification provided in response to any inquiry raised during the pre-proposal conference. A Proposer who does not attend the pre-proposal conference will not be considered and disqualified.

XII. PRE-PROPOSAL QUESTIONS

Proposers with questions or requiring clarification or interpretation of any section within this RFP must address their questions in writing or via e-mail to the sole point of contact John Calanayan john.calanayan@dpw.guam.gov on or before the deadline set forth in the RFP Timelines. Each question must provide clear reference to the section, page, and item of this RFP in question. Questions received after the deadline shall not be considered.

XIII. EXPLANATION TO PROPOSERS

No oral explanation in regard to the meaning of any part of this RFP will be made, and no oral instructions will be given, before the award of the contract. Discrepancies, omissions, or doubts as to the meaning of the specification shall be communicated in writing to the sole point of contact at DPW. Questions about any part of this RFP shall be communicated in writing to the sole point of contact at the Department of Public Works for interpretation before the deadline. Proposers should act promptly and allow sufficient time for a written reply to reach them before the submission of their proposal. Interpretation, if required, shall be made in the form of an amendment to the RFP which will be forwarded to all Proposers, and its receipt by the Proposer must be acknowledged.

XIV. DPW's ANSWERS

DPW's response will be by written addendum. Any other form of interpretation, correction, or change to this RFP will not be binding with the DPW. Any written addendum will be forwarded to all entities or individuals who have picked up an RFP and are included on the Register of Proposals Form. **All addenda shall form a part of the RFP documents and must be acknowledged upon receipt. Failure to acknowledge receipt of each addendum may be grounds for disqualification.**

XV. WITHDRAWAL OF PROPOSALS

Proposals may be withdrawn on written request received from the Proposer(s) prior to the time fixed for opening. Negligence on the part of the Proposer in preparing the proposal confers no right for the withdrawal of the proposal after it has been opened.

XVI. ALTERNATE OR MULTIPLE PROPOSALS NOT ACCEPTED

Alternate or multiple proposals will not be accepted. Any Proposer submitting alternate, multiple, or otherwise altered proposals will be deemed nonresponsive and disqualified from this solicitation.

XVII. NO LATE PROPOSALS

Proposals must be received at the DPW TMC Building, CIP Contract Section, by the Proposal Due Date set forth in the RFP Timelines. **Email or facsimile proposals will not be accepted**. Regardless of cause, late proposals will not be accepted and will automatically be disqualified from further consideration. It shall be the Proposer's sole risk to assure delivery at the DPW TMC Building, CIP Contract Section receptionist's desk by the designated time.

XVIII. PROHIBITION AGAINST EMPLOYMENT OF SEX OFFENDERS

Pursuant to 5 G.C.A. § 5253,

1. No person convicted of a sex offense under the provisions of Chapter 25 of Title 9 Guam Code Annotated, or an offense as defined in Article 2 of Chapter 28, Title 9 GCA in Guam, or an offense in any jurisdiction which includes, at a minimum, all of the elements of said offenses, or who is listed on the Sex Offender Registry, and who is employed by a business contracted to perform services for an agency or instrumentality of the government of Guam, shall work for his employer on the property of the government of Guam other than a public highway.

2. All contracts for services to agencies listed herein shall include the following provisions: (1) warranties that no person providing services on behalf of the contractor has been convicted of a sex offense under the provisions of Chapter 25 of Title 9 GCA or an offense as defined in Article 2 of Chapter 28, Title 9 GCA, or an offense in another jurisdiction with, at a minimum, the same elements as such offenses, or who is listed on the Sex Offender Registry; and (2) that if any person providing services on behalf of the contractor is convicted of a sex offense under the provisions of Chapter 25 of Title 9 GCA or an offense as defined in Article 2 of Chapter 28, Title 9 GCA or an offense in another jurisdiction with, at a minimum, the same elements as such offenses, or who is listed on the Sex Offender Registry, that such person will be immediately removed from working at said agency and that the administrator of said agency be informed of such within twenty-four (24) hours of such conviction.

XIX. EQUAL OPPORTUNITY

1. The DPW will not discriminate against any employee or applicant for employment because of race, religion, sex, color, age, economic status, or national origin. The Contractor will take affirmative action to ensure that qualified applicants are employed and that employees are treated during employment without regard to their race, religion, sex, color, age, economic status, or national origin. Such action shall include, but not be limited to, the following: Employment, upgrading, demotion or transfer, recruitment or recruitment advertising, layoffs or termination, rates of pay or other forms of compensation, and selection for training including apprenticeship.

The Contractor agrees to post in conspicuous places, available to employees and applicants for employment, notices to be provided by the Contracting Officer setting forth the provisions of this nondiscrimination clause.

2. The DPW will, in all solicitations or advertisements for employees placed by or on behalf of the Government of Guam, state that all qualified applicants will receive consideration for employment without regard to race, religion, sex, color, age, economic status, or national origin.

XX. RECEIPT/OPENING OF PROPOSALS

Proposals and modifications will be time-stamped upon receipt and held in a secure place until the established due date. After the date established for receipt of proposals, a Register of Proposals will be prepared. Proposals and modifications will be shown only to government personnel having a legitimate interest in them. The Register of Proposals will be opened to public inspection only after award.

XXI. CLASSIFICATION OF PROPOSALS AS RESPONSIVE OR NON-RESPONSIVE

All proposals will initially be classified as either "responsive" or "non-responsive" (*see RFP Attachment 8*). Proposals may be found non-responsive any time during the evaluation process or contract negotiation if any of the required information is not provided or the proposal is not within the plans and specifications described and required in the RFP. If a proposal is found to be non-responsive, it will not be considered further.

XXII. DETERMINATION OF RESPONSIBILITY

The procurement officer will determine whether a Proposer has met the standards of responsibility, per Guam procurement law. Such a determination may be made at any time during the evaluation process and through contract negotiation if information surfaces that would result in a determination of non-responsibility. If a Proposer is found non-responsible, the determination must be in writing, made a part of the procurement file and mailed to the affected Proposer.

XXIII. COMPLETENESS OF PROPOSALS

Selection and award will be based on the information contained in the Proposer's proposal. Proposals may not include references to information located elsewhere, such as Internet websites or libraries, unless specifically requested by DPW. Information or materials presented by Proposers outside the formal response or subsequent discussion/negotiation will not be considered, will have no bearing on any award, and may result in the Proposer being disqualified from further consideration.

XXIV. FAILURE TO COMPLY WITH INSTRUCTIONS

Proposers failing to comply with the instructions set forth in this RFP may be subject to point deductions. DPW may also choose to not evaluate, may deem non-responsive, and/or may disqualify from further consideration any proposals that do not follow this

RFP format, are difficult to understand, are difficult to read, or are missing any requested information.

XXV. DPW RIGHTS RESERVED

While DPW and the Government of Guam have every intention to issue an award as a result of this RFP, issuance of the RFP in no way constitutes a commitment by DPW or the Government of Guam to award and execute a contract. Upon a determination such actions would be in its best interest, DPW, in its sole discretion, reserves the right to:

1. Cancel or terminate this RFP as provided in the Guam Procurement Regulations;
2. Reject any or all proposals received in response to this RFP in the best interests of DPW or the Government of Guam as provided in the Guam Procurement Regulations;
3. Waive any undesirable, inconsequential, or inconsistent provisions of this RFP which would not have significant impact on any proposal;
4. Waive any minor informalities in proposals received, or have them corrected by the Proposer in accordance with applicable regulations;
5. Not award if it is in the best interest of DPW or the government of Guam not to proceed with contract execution; or
6. If awarded, terminate any contract if DPW determines adequate funds are not available.

XXVI. NON-DISCLOSURE OF DATA

In accordance with Guam Procurement Regulations § 3114(h) (2), Proposers may identify trade secrets and other proprietary data contained in their proposals. If the Proposer selected for award has requested in writing the nondisclosure of trade secrets and other proprietary data so identified, DPW shall examine the request to determine its validity prior to entering into negotiations. If the parties do not agree as to the disclosure of data, DPW shall inform the Proposer in writing what portion of the proposal will be disclosed and that, unless the Proposer withdraws the proposal or protests under 5 G.C.A. Chapter 5 Article 9, the proposal will be so disclosed.

XXVII. REJECTION OF PROPOSAL OFFER.

The Department of Public Works shall have the prerogative to reject any proposals in whole or in part if a determination is made that such rejection is in DPW's interest or in the best interest of the Territory of Guam as provided for in the regulations 2 GAR, Div. 4 §3115(e)(2).

XXVIII. CANCELLATION OF RFP SOLICITATION

Prior to the date deadline set for proposals, this solicitation may be canceled in whole or in part when the Director of Public Works or his designee determines in writing that there are cogent and compelling reasons to believe that the cancellation of the solicitation is in the Department of Public Works best interest, in accordance with the

Procurement Rules and Regulations; as provided for in the regulations 5 GCA §5225; 2 GAR, Div. 4 §3115(c).

XXIX. DEBARMENT

The Proposer certifies, by submitting its proposal, that neither it nor its principals are presently debarred, suspended, proposed for debarment, declared ineligible, or voluntarily excluded from participation in this transaction by any governmental department or agency. If a Proposer cannot certify this statement, attach a written explanation for review by the DPW.

XXX. PERFORMANCE AND PAYMENT BOND

The successful bidder must deliver to the Owner an executed performance and payment bond (forms enclosed) in an amount at least equal to one hundred percent (100%) of the accepted bid as security for the faithful performance of the contract and security for the payment of all persons performing labor and furnishing materials in connection with this contract. The sureties of all bonds shall be such surety company or companies as are approved by the Owner and as are authorized to transact business in Guam. The bonds must be approved by the Owner prior to execution of the formal contract.

XXXI. INDEMNIFICATION

The Proposer shall indemnify the Government of Guam, DPW, GDOE, GEDA and their Consultants from any liability arising from the implementation of the Proposer's proposal.

XXXII. RFP ATTACHMENTS & LEGAL REQUIREMENTS

The following are RFP Attachments and are made part of this RFP:

1. **Financing Scope of Work** (*reference RFP ATTACHMENT A*).
2. **Design/Construction & Insurance/Capital Maintenance Scope of Work** *(reference RFP ATTACHMENT B).*
3. **Affidavit Disclosing Ownership and Commissions** per 5 G.C.A. § 5233 *(reference: RFP ATTACHMENT 1).* As a condition of this RFP, any partnership, sole proprietorship, joint venture, association or corporation doing business with the government of Guam shall submit an affidavit executed under oath that lists the name and address of any persons, companies, partners, or joint ventures who have held more than ten percent (10%) of the outstanding interest or shares in said partnership, sole proprietorship joint venture, association or corporation at any time during the 365 days immediately preceding the submission date of a proposal. The affidavit shall contain the number of shares or the percentage of all assets of such partnership, sole proprietorship joint venture, association or corporation that have been held by each such person during the 365-day period. In addition, the affidavit shall contain the name and address of any person who has received or is entitled to receive a commission, gratuity or other compensation for procuring or assisting in obtaining business related to this RFP for the Proposer and shall also contain the amounts of any such commission, gratuity or other compensation. The affidavit shall be open and available

to the public for inspection and copying. *See RFP Legal Form: Affidavit re Disclosing Ownership (Major Shareholders) & Commissions; AG Procurement Form 002.*

4. **Affidavit of Non-Collusion** per 2 GAR Division 4 § 3126(b) *(reference RFP ATTACHMENT 2)*. By submitting an offer, the Proposer certifies that the price submitted was independently arrived at without collusion. *See RFP Legal Form: Affidavit re Non-Collusion; AG Procurement Form 003.*

5. **Affidavit Re No Gratuities or Kickbacks** per 2 GAR Division 4 § 11107(e) *(reference RFP ATTACHMENT 3)*. The bidder, Proposer, or contractor represents that it has not violated, is not violating, and promises that it will not violate the prohibition against gratuities and kickbacks set forth in §11206 (Gratuities and Kickbacks) of the Guam Procurement Regulations. **Gratuities**. It shall be a breach of ethical standards for any person to offer, give or agree to give any employee or former employee, or for any employee or former employee to solicit, demand, accept or agree to accept from another person, a gratuity or an offer of employment in connection with any decision, approval, disapproval, recommendation, preparation of any part of a program requirement or a purchase request, influencing the content of any specification or procurement standard, rendering of advice, investigation, auditing, or in any other advisory capacity in any proceeding or application, request for ruling, determination, claim or controversy, or other particular matter, pertaining to any program requirement or a contract or subcontract; or to any solicitation or proposal therefor. **Kickbacks**. It shall be a breach of ethical standards for any payment, gratuity or offer of employment to be made by or on behalf of a subcontractor under a contract to the prime contractor or higher tier subcontractor or any person associated therewith, as an inducement for the award of a subcontract or order. *See RFP Legal Form: Affidavit Re No Gratuities or Kickbacks; AG Procurement Form 004.*

6. **Affidavit Re Contingent Fees** per 2 GAR § 11108 *(reference: RFP ATTACHMENT 4)*. It shall be a breach of ethical standards for a person to be retained, or to retain a person, to solicit or secure a government contract upon an agreement or understanding for a commission, percentage, brokerage, or contingent fee, except for retention of bona fide employees or bona fide established commercial selling agencies for the purpose of securing business. *See RFP Legal Form: Affidavit Re Contingent Fees; AG Procurement Form 007.*

7. **Affidavit Re Ethical Standards** per 2 GAR § 11103 *(reference: RFP ATTACHMENT 5)*. The bidder, Proposer, or contractor represents that it has not knowingly influenced and promises that it will not knowingly influence a government employee to breach any of the ethical standards set forth in 5 GCA Chapter 5 Article 11 (Ethics in Public Contracting) of the Guam Procurement Act and in Chapter 11 of the Guam Procurement Regulations. *See RFP Legal Form: Re Ethical Standards; AG Procurement Form 005.*

8. **DECLARATION RE COMPLIANCE WITH U.S. DOL WAGE DETERMINATION** *(reference: RFP ATTACHMENT 6)*.

9. **ACKNOWLEDGEMENT OF RECEIPT FORM** *(reference: RFP ATTACHMENT 7)*.

10. **DPW CHECKLIST OF RESPOSIVENESS** *(reference: RFP ATTACHMENT 8).*

11. **PRICE PROPOSAL FORM** *(reference: RFP ATTACHMENT 9).*

XXXIII. OPENING OF PROPOSALS

Proposals will not be opened publicly and will be opened in the presence of two or more DPW officials. Proposals will be checked for compliance with the mandatory requirements of the RFP. Failure to comply with any mandatory requirements may cause disqualification.

XXXIV. EVALUATION OF PROPOSALS AND AWARD OF CONTRACT

Proposals will be evaluated and ranked by the criteria provided in this RFP by a committee established by the ***"MA KÅHAT ACT of 2013"*** **and any subsequent/relevant Public Laws**. The Evaluation Committee includes:

1. GDOE Superintendent as the Chairperson
2. DPW Director or Deputy Director
3. DPW Building Permits Administrator
4. Director of Land Management or Guam Chief Planner
5. Administrator of Guam Economic Development Authority or Deputy Administrator
6. Principal of Simon Sanchez High School or his/her designee

Evaluation Process

1. Due to the complexity and diversity of the scope of services required in this RFP (finance, demolition, design, build, lease/leaseback, insurance and capital maintenance), DPW intends to convene the Evaluation Committee with subject matter experts (SMEs), to provide technical clarifications in specific areas. SMEs will not participate in scoring but may provide input to assist the committee in evaluating.

2. Each member of the Evaluation Committee will evaluate each proposal based on the qualifications outlined in Section XXXIV. Evaluation, Rating and Selection Table. The sealed Term Sheet and Price Proposal will not be used as the basis of the evaluation.

3. Each member of the Evaluation Committee will evaluate each proposal and rank each proposal based on the assigned points for each criterion (i.e., the Proposer with the greatest total points will be ranked the highest and the Proposer with the least number of points will be ranked the lowest).

4. Interviews will be conducted with the Proposers by the Evaluation Committee. After the interviews, each member of the Evaluation Committee will submit their Individual Evaluation Forms, which will be used as the basis of selection. The Evaluation Committee will conduct interviews with a minimum of the top three (3) qualified Proposers and will notify the Proposers with a date and time. The Proposer

must appear in person. Each Proposer will have thirty (30) minutes to make a presentation and thirty (30) minutes to answer questions. Proposers will be notified of the location of the interviews at a future date.

5. Tie Breaker Procedure: If two (2) or more Proposers' ranks are equal, the Chairperson will evaluate the proposals to break the tie.

6. The Evaluation Committee will prepare a report determining the best qualified Proposer with ranking order of preference, submit it to the DPW Director, and recommend the number one ranked Proposer for the first opportunity to negotiate a contract.

7. The DPW Director will review the report from the Evaluation Committee and will approve or disapprove the recommendation as deemed to be the best qualified to provide the required services and that is in the best interest of the Government. Failure to comply with any mandatory requirements may disqualify a proposal.

8. The Government will enter negotiations with the best qualified Proposer, at which time their sealed individual Term Sheet and individual Price Proposal will be opened for negotiation.

XXXV. EVALUATION CRITERIA

The evaluation will follow the criteria outlined in the Evaluation, Rating and Selection Table outlined in the section that follows. Proposers are requested to submit proposals, which are complete and unambiguous without the need for additional explanation or information. DPW may make a final determination as to whether a proposal is acceptable or unacceptable solely on the basis of the proposal as submitted and proceed with proposal evaluation without requesting further information from any Proposers.

XXXVI. EVALUATION, RATING AND SELECTION TABLE

In the evaluation, rating and selection of proposals, the evaluation factors and their relative importance follow. All proposals submitted will be evaluated by the Evaluation Committee and will be rated using the criteria provided in this RFP including the following:

EVALUATION CRITERIA	MAX SCORE	SCORE
Proposal Plan Overall proposal approach. A plan giving as much detail as practical on how the services will be performed. *(Refer to VII. INSTRUCTIONS FOR SUBMITTING A PROPOSAL, 2 Entire Contents section.)*	**15**	
Personnel Experience and Qualifications Specialized experience and qualifications of personnel to perform the required services. *(Refer to VII. INSTRUCTIONS FOR SUBMITTING A PROPOSAL, 2. Contents, Section 4, Personnel Experience and Qualifications)*	**20**	

EVALUATION CRITERIA	MAX SCORE	SCORE
Capacity of Proposer The Proposer's ability to perform the required services with its current resources and workload to meet the expected project outcome. *(Refer to VII. INSTRUCTIONS FOR SUBMITTING A PROPOSAL; 2. Contents, Section 5 Approach and Capacity of Proposer).*	**30**	
Proposer's Experience on Similar Projects The Proposer's specialized and extensive experience in projects similar in scope and nature in managing a project of this magnitude and is familiar with the tropical environment and unique logistical challenges. (Refer to VII. *INSTRUCTIONS FOR SUBMITTING A PROPOSAL, 2. Contents, Section 6 Experience on Similar Projects).*	**25**	
Performance Issues Proposer's performance issues related to past or present contracts and/or ongoing procurement. (Refer to VII. *INSTRUCTIONS FOR SUBMITTING A PROPOSAL, 2. Contents, Section 7 Performance Issues). *Note Proposers with the least amount of issues should score higher.*	**10**	
TOTAL POINTS	**100**

XXXIX. TERM SHEET AND PRICE PROPOSAL SUBMITTAL

The Term Sheet and Price Proposal will be unsealed from the Highest Ranked Proposer prior to Negotiations and must be within the budgetary ceiling outlined within the "MA KÅHAT ACT OF 2013" AND ANY SUBSEQUENT Public Laws as relevant.

XL. NEGOTIATION AND AWARD OF CONTRACT

DPW, GEDA, and GDOE will negotiate a final contract with the best-qualified Proposer for the required services to ensure that the final contract meets the government's project objectives, financial interest and is consistent with the budgetary parameters outlined in Guam public law.

Contract negotiations will be directed towards:

1. Ensuring that the Proposer has a clear understanding of the scope of work, specifically, the essential requirements involved in providing the required services;
2. Agreeing upon final terms and compensation, which are fair and reasonable, taking into account the estimated cost of the project, the project schedule, funding parameters defined by law, the required services and the scope, complexity, and nature of such services.

XLI. SUCCESSFUL NEGOTIATION OF CONTRACT WITH QUALIFIED PROPOSER

If compensation, contract requirements, and contract documents can be agreed upon with the best-qualified Proposer, the contract will be awarded to the Proposer.

XLII. FAILURE TO NEGOTIATE CONTRACT WITH BEST QUALIFIED PROPOSER

If compensation, contract requirements, or contract documents cannot be agreed upon with the best qualified Proposer, a written record stating the reasons therefore shall be placed in the file and the Department of Public Works will advise such Proposer of the termination of negotiations which shall be confirmed by written notice. Upon failure to

negotiate a contract with the best-qualified Proposer, the Department of Public Works will enter negotiations with the next most qualified Proposer. If negotiations again fail, negotiations will be terminated as provided in this Section and commence with next most qualified Proposer.

XLIII. NOTICE OF AWARD

The Department of Public Works will notify all Proposers of the status of the RFP and intent to award. Written notice of award will be public information and made a part of the contract file.

XLIV. AWARDING OF CONTRACT

The Department of Public Works will negotiate a contract with the best qualified Proposer for the required services. If compensation, contract requirements, and contract documents can be agreed upon with the Proposer, a contract will be awarded to this Proposer.

XLV. COMMENCEMENT OF WORK

DPW will issue a Notice to Proceed (NTP) for services for the project upon approval of Contract Agreement. A separate NTP for demolition and clearing may be issued earlier to expedite the construction schedule.

XLVI. DEFINITIONS

- **Request for Proposals (RFP**) shall mean the invitation to invite proposals for the construction of the new Simon Sanchez High School. Proposal includes: Financing; Demolition of the existing facility; Design, Build, Lease/Leaseback, Insure the facility; operate and maintain the new facility for no more than 30 years.
- **Owner** shall mean the Guam Department of Education and the Governor of Guam, and/or his/her authorized representatives.
- **Contracting Officer** as used herein means the Director of Public Works of the Government of Guam and shall include his authorized representatives.
- **Critical Path Method (CPM**) shall mean the schedule that integrates the sequence of activities, task dependencies, durations, and critical milestones required for the financing, design, and construction of the New Simon Sanchez High School FDDBML Project. The CPM Schedule must be developed in accordance with contractual requirements, financial milestones, and performance obligations, ensuring completion within the 730-day period specified in the RFP. The 30-year leaseback period is excluded from the scheduling requirements.
- **Proposer** shall mean any developer, contractor, and finance companies legally operating under the US State or Territorial Laws and subject to Guam licensing regulations.
- ***MA KÅHAT ACT OF 2013*** shall mean Chapter 58D of Title 5, Guam Code Annotated.

- **FF&E** shall mean fixtures, furniture, and equipment for the new Simon Sanchez High School.
- **FF&E Services** shall mean the financing, procurement, storage, and installation of the FF&E.
- **Term Sheet** shall mean a formal document submitted by the Proposer that outlines the preliminary financial and contractual terms of the proposed financing arrangement for the project. This document provides a high-level summary of the financing structure, repayment mechanisms, risk allocation, and compliance with the requirements outlined in Attachment A—Financing Scope of Work of the RFP.
- **Price Proposal** shall mean the completed Price Proposal and Addenda Acknowledgment of Receipt Form
- **Notice** as used herein shall mean and include all written notice demands, instructions, claims, approvals and disapprovals required to obtain compliance with contract requirements. Any written notice by either party to the contract shall be sufficiently given if delivered to or at the last know business address of the person, firm, or corporation constituting the other party to the contract, or to his, their, or its duly authorized agent, representative, or officers, or when enclosed in a postage prepaid envelope addressed to such last known business address and deposited in a United States mail box. The Contractor must provide and maintain a post office address within the Territory of Guam and file the same with the Contracting Officer.
- **Responsiveness** as used herein shall mean all items listed on RFP Attachment A.
- **Responsibility** as used herein is defined by Section XXII. Determination of Responsibility and Guam Procurement law.
- **Debarment** as used herein is defined by Section XXIX Debarment and may be extended to subcontractors of the Proposer.
- **Critical Path Method (CPM)** is the construction schedule which networks techniques used for planning, scheduling, and controlling large complex projects.
- **Evaluation Committee** shall include the GDOE Superintendent as Chairperson, and the following five (5) members DPW Director or Deputy Director, DPW Building Permit Administrator, Director of Land Management or Guam Chief Planner, GEDA Administrator or Deputy Administrator, and Principal of Simon Sanchez High School.
- **Liquidated Damages** are contracted for damages before a contract breach that enforces an estimate of harm that would be hard to calculate with certainty. The Government reserves the right to negotiate the amount of Liquidated Damages provision with the Successful Proposer.

FINANCING SCOPE OF WORK

ATTACHMENT A

FINANCING SCOPE OF WORK

As the Guam Economic Development Authority ("GEDA") serves as the central financial manager and consultant for the Government of Guam ("Government") and those agencies or instrumentalities of the Government requiring financial guidance and assistance, GEDA is required to participate in any and all market related activities. The Proposer shall work with the Government and GEDA during the finance phase of this procurement to provide funds for the design (including architectural and engineering), demolition, construction of Simon Sanchez High School and to provide furniture and equipment. Any fees or expenses incurred by the Government or GEDA during this phase shall be covered by the financing.

The Proposer must also be able to provide capital maintenance and insurance for the school as a result of this RFP for the duration of the lease agreement. Funding shall be by annual legislative appropriation.

To minimize the cost to the Government of Guam, financing utilized by the successful proposer to fund the design, demolition, construction and FF&E services for the new Simon Sanchez High School shall be through tax-exempt obligations, or other financial instruments issued in conjunction with the Guam Economic Development Authority (GEDA). The successful Proposer and GEDA may use an alternative method of financing, including, but not limited to, a short-term debt, mortgage, loan, federally guaranteed loan, or loan by an instrumentality of the United States of America if such financing will better serve the needs of the people of Guam, subject to approval by I Liheslaturan Guåhan.

The purpose for this Section is to assure the Government of Guam pays the lowest possible interest rate so that the cost to the Government of Guam in financing the design, demolition, construction and FF&E services of the new Simon Sanchez High School, amortized through the lease/lease-back payments from the Government of Guam to the successful Proposer, will be lower than regular commercial rates.

Proposer must be able to provide capital maintenance for the new Simon Sanchez High School and must also provide typhoon, fire, earthquake and vandalism insurance as negotiated. Proposer must obtain all required property, liability and workmen's compensation insurance. The successful proposer shall provide a separate cost for the annual Insurance, Maintenance and Capital Maintenance of the new Simon Sanchez High School.

FINANCIAL DESCRIPTION

Leaseback agreement.

The Government of Guam, through the Guam Department of Education, as Lessor, shall enter into a leaseback agreement which the Government of Guam shall lease the Simon Sanchez High School property for a period of no more than thirty (30) years from the scheduled date of completion of the school at a cost of one dollar ($1) per year and Lessee shall lease back said property to the Government of Guam at the lease payment offered and accepted through this RFP for use as an educational facility.

The financing has been authorized by Chapter 58D of Title 5, Guam Code Annotated, known as the "*MA KÅHAT ACT OF 2013*" specifically for the financing, construction, demolition of the existing facility, provision of FF&E services and insurance and maintenance.

Pursuant to 5 GCA §58D103(b), at the expiration of the lease-back period, the government of Guam property and the education facility that is renovated or constructed on the government of Guam property will revert to the government of Guam with no further obligations to the Proposer.

Key Lease Terms.

The Government of Guam through the Guam Department of Education shall pay the Lessor, on an annual basis for all lease payments due in accordance with the terms of the contract, which may include any payments to GEDA or the Proposer due under the contract, and in accordance with applicable laws. Such portions of lease payments or forms of payments owed to the Proposer under the contract may be assigned by the Lessor.

All payments shall be made in accordance with Chapter 58D of Title 5 of the Guam Code Annotated. The Proposer (Lessor) shall submit one (1) annual invoice in **original** form, for lease payments due as well as for base rentals to cover the cost of annual insurance and maintenance costs.

Non-Appropriation Clause: In event that sufficient funds (a) are not appropriated by the Government prior to the beginning of any Renewal Term for the payment of the Base Rentals on the Base Rental Payment Dates and reasonably estimated Additional Rental Payment Dates and reasonably estimated Additional Rentals payable during such Renewal Term, or (b) are otherwise not legally available for such purpose, then an Event of Non-Appropriation shall be deemed to have occurred.

If an Event of Non-Appropriation has occurred, the Government shall not be obligated to make payment of the Base Rentals or Additional Rentals provided for in the lease beyond the last day of the Renewal Term during which such Event of Non-Appropriation occurs.

If the Government fails to perform as Lessee under the lease or fails to appropriate lease payments, the lease may provide that its term shall be extended for a period not to exceed the shorter of ten (10) years beyond the original term of the leaseback or such period of time as is necessary to repay in full any financing arranged pursuant to § 58D108. However, once the term of the ground lease expires, the Government is entitled to repossession of the site together with all improvements on the site free and clear of any interest.

If the Government loses the use of the leased facility under certain circumstances, lease payments will be made only during the times GDOE has full use of the leased facility. This could result in partial lease payments for the entire contract period.

FINANCE

Pursuant to 5 GCA §58D108, to minimize the cost to the government of Guam, financing utilized by the Proposer to fund the construction of and FF&E services for the new Simon Sanchez High School financing shall be through tax-exempt obligations, or other financial instruments; provided, that such financing is available at an interest rate of no more than eight-and-a-half percent (8.5%). The Proposer may use an alternative method of financing, including, but not limited to, a short-term debt, mortgage, loan, federally guaranteed loan, or loan by an instrumentality of the United States of America if such financing will better serve the needs of the people of Guam, subject to approval by *I Liheslaturan Guåhan*.

Supplemental Information

i.) The terms and conditions of the bonds shall be as determined by *I Maga'hagan Guahan* by the execution of a certificate or indenture authorizing the issuance of the bonds; provided, however, that the bonds are expected to mature not later than thirty (30) years after their date of issuance, shall bear interest at such rates and be sold for such price or prices as shall result in a yield to the bondholders that does not exceed eight and one-half percent (8.50%) per annum;

ii.) Any such pledge or reservation authorized under the indenture or similar instrument shall be valid and binding from the time the pledge or reservation is made; and

iii.) The bonds will not be "public indebtedness" as that term is defined in 48 USC §1423(a), §11 of the Organic Act of Guam.

iv.) Rental Payments from Lawfully Available Moneys. Rental payments under the lease and the lease-back, as well as funding required to support the activities set forth in Title 5 GCA Chapter 58D, may be reserved and payable from any lawfully available moneys of the government of Guam, and may be secured by a pledge or other reservation of such moneys on an annual basis.

TERMS OF PAYMENT

(see RFP section VIII. TERMS OF PAYMENT)

PLEDGED GENERAL FUND REVENUES

Rental payments under the lease and the lease-back may be secured by a pledge or other reservation of revenues payable from any lawfully available monies of the Government of Guam and may be secured by a pledge or other reservation of such monies on an annual basis.

Attachment B-1: Topographic Survey
Attachment B-2: Biological Assessment
Attachment B-3: Archaeology Report
Attachment B-4: Geotechnical Report
Attachment B-5: Programming Document Drawing Index Scope
Attachment B-6: Hazardous Material Demolition
Attachment B-7: Programming Document Drawings
Attachment B-8: Programming Document Specifications
Attachment B-9: AV Systems
Attachment B-10: Theater Systems
Attachment B-11: Room Requirements
Attachment B-12: FF&E
Attachment B-13: Acoustical Design Criteria
Attachment B-14: SSHS Finishes Document
Attachment B-15: Civil, Structural, Mechanical, Fire Protection, Electrical, and Telecom Narratives
Attachment B-16: CAHA Requirements
Attachment B-17: DPW Construction Management (CM) Requirements

A. Project Timeframe: 730 days for construction and full occupancy.

B. General Design Requirements

1. Provide the Final A/E Construction Documents for the project and all permits/clearances for construction and occupancy.

   The design documents prepared by TRMA and its consultants are not final construction documents. These serve solely as a preliminary basis for the developer, the developer's contractor, and A/E Designers of Record who are responsible for preparing the final construction documents for building regulations compliance, final programming requirements, financing, constructability, maintenance, and final price determination.

2. The Developer is responsible for procurement and installation of Furniture, Fixtures, and Equipment (FF&E).

3. Facilitate GDOE Review of the Developer's A/E Final Construction Documents at 60% Design Development and Final Design stages. These include GDOE Commissioning Design Review.

4. Disregard references to alternate bid items in the programming documents. The total cost must be for the financing, construction, and maintenance of the entire project scope and itemized as required in Part D.

5. Provide biological conservation measures prior to use of the site for clearing & grading or demolition. Refer to Part F1.

6. Provide geotechnical investigation work required for the Final Construction Documents.

7. Expedite demolition, clearing & grading, geotechnical, and building permit applications. Design work for the Final Construction Documents may be structured to allow for demolition, geotechnical work, clearing, and grading permit applications prior to Final Construction Document completion.

8. Expedite design work needed for construction procurement of long-lead materials, building systems, and FF&E.

C. General Construction Requirements

1. Ensure that all construction phase requirements are met.

2. Provide all required insurance.

3. Coordinate with GDOE, SSHS, and FBLG:

   a. Provide FBLG with all emergency contact information for the contractor and developer's project/construction manager.

   b. Provide 1-week notice prior to commencement of work activities within 100-ft of FBLG school grounds.

   c. Provide 3-weeks' notice prior to any utility work that will affect FBLG school.

4. Provide and Maintain Biological Conservation Measures. Refer to Part F1.
5. Obtain Demolition, Clearing & Grading, and Building Permits
6. Expedite procurement of long-lead materials, building systems, and FF&E.
7. Provide Temporary Utilities
8. Provide Engineering Special Inspections
9. Obtain Occupancy Permit
10. Comply with GDOE Commissioning Requirements
11. Provide and Install FF&E
12. Facilitate Sanitary Permit Application and Inspections with GDOE
13. Refer to Attachment B-18 DPW Construction Management (CM) Requirements

D. Project Scope

1. The project scope consists of:
    a. General Requirements for Design and Construction
    b. Financing
    c. Insurance, Capital Maintenance and Custodial Plan
    d. Site Development & Sports Facilities
    e. Administration Building, Main Entrance, Covered Walkways, and Courtyard
    f. A-wing Classroom Building
    g. Gymnasium Building
    h. B-wing Classroom Building
    i. Cafeteria
    j. JROTC Classroom Building and Multipurpose Space
    k. C-wing Classroom Building
    l. Auditorium including FF&E, Audio Visual, and Theater Specialty systems.
    m. Photovoltaic System
    n. Rainwater Catchment System
    o. Landscaping Plants, Irrigation, and Site Furnishing
    p. Credit Recovery Building

Price determination must be based on the entire project scope per the Programming Document Design and the required design development work for the Final Construction

Documents. Complete the Price Proposal Form (Attachment 9) and submit it with the sealed term sheet.

E. School Population

1. 2,000 students
2. Teachers and staff, 150 total
3. Buses, 22 total
4. Student & Guest Parking, 204 total
5. The programming document design is based on a 1,700-student population. The Final Construction Documents must comply with all requirements for a 2,000-student population except:
    a. No additional classroom spaces are required.
    b. No additional cafeteria seating is required.
    c. No additional gymnasium bleacher seating is required.
    d. No additional space is required for the library.
    e. No additional office space is required.
    f. No additional sports field spectator seating is required.
    g. No additional storage space is required.
    h. No additional courtyard seating is required.
    i. No additional employee and student parking is required.

F. Design Requirements:

1. Biological Conservation Measures
    a. Provide Biological conservation measures prior to any work onsite.
    b. Conduct an environmental survey to confirm the current site condition relative to the presence of any endangered species. Identify any changes to the information noted in Attachment B-2 Biological Assessment Report. Include a biological census to document the actual number of endangered species present on the site as required for a US Fish and Wildlife Services (USFWS) Incidental Take Permit Application.
    c. Execute a USFWS Incidental Take Permit Application for the translocation of endangered species found onsite to the new habitat designated in the programming document design.
    d. Obtain USFWS and Department of Agriculture approval prior to translocation of endangered species.
    e. Establish the new habitat prior to translocation of endangered species.

f. Complete the Incidental Take Permit Application and Translocation of the identified snail colony prior to construction of the shared multipurpose sports field.

g. Provide periodic biological monitoring during and after construction as required by the Guam Department of Agriculture and USFWS.

2. Demolition

a. Demolish the existing SSHS campus facilities excluding the Cafeteria and protect items required to be salvaged and relocated.

b. Comply with all requirements for Hazardous Material demolition work noted in the programming document.

c. Salvage the existing Simon Sanchez statue and relocate to the main entrance of the new campus. Coordinate salvage with time capsule opening by SSHS and GDOE.

d. Salvage items and relocate as identified in the programming document design.

3. Bus Stop

a. Protect the existing bus stop along Juan Jacinto Drive for uninterrupted use until the new bus stop is constructed and cleared for use by the government.

b. Provide the new bus stop adjacent to the primary car entrance and guard house prior to demolition of the existing bus stop.

4. Traffic Circulation and Parking

a. Locate the bus entrance/exit for the campus at the southeastern corner of the site along Juan Jacinto Drive.

b. Locate car entry/exits on the east side of the site along Juan Jacinto Drive to mitigate traffic issues along the north side of the site. Provide a guard house at the primary car entrance gate.

c. Provide a continuous emergency vehicle access road along the perimeter of the campus buildings.

d. Provide parking adjacent to the campus facilities and the sports facilities.

5. Community Walking Path

a. Provide a community walking path along the east side of the campus. The fence along the community walking path must incorporate local artist murals/artwork.

6. Credit Recovery Building

a. Provide the Credit Recovery building as a separate facility from the rest of the SSHS campus with separate parking and after-hours vehicular access.

7. Auditorium and Gymnasium

    a. Locate the Auditorium and Gymnasium adjacent to parking areas to accommodate after school hours use of these facilities.

8. Drill Pad

    a. Provide a concrete drill pad at the exterior grounds in general proximity to the JROTC program location.

9. Courtyard Space and Main Entrance

    a. Place campus buildings around a secured central courtyard excluding the credit recovery building. The primary entry for the campus buildings must be through the courtyard space.

    b. Provide a covered Main Entrance that functions as the primary controlled entry point together with the school office. Provide electronic access-controlled egress gates from the courtyard. Provide lockable decorative aluminum main entrance gates.

    c. Relocate the existing Simon Sanchez statue to the Main Entrance with a new 3-ft high concrete pedestal with a dedication plaque commemorating Simon Sanchez's historic significance.

    d. Provide four flag poles adjacent to the Main Entrance.

    e. Provide monument signage adjacent to the Main Entrance.

    f. Provide a covered walkway from the car rider drop-off area to the main office entrance.

    g. Provide a bus canopy (pedestrian covered walkway) from the bus drop-off area to the main courtyard. A secondary entrance into the courtyard may be used for the bus canopy.

    h. Provide covered walkways within the courtyard connecting the separate school building entrances and include covered student benches with adequate rain protection.

    i. Provide convenience walkways through the courtyard space and uncovered seating.

    j. Provide electronic access-controlled egress gates from the courtyard to the fire lanes/exit discharge areas.

    k. Secure the courtyard from other campus facilities that are used after school hours such as the Gymnasium and Auditorium.

    l. Provide access to 1st floor restrooms from the covered building entrances/walkways at the courtyard.

    m. Provide a stage for assembly events in the courtyard.

n. Do not place student lockers along the courtyard.

o. Provide student planting areas.

p. Provide trellis-covered outdoor learning areas.

q. Provide convenience outlets throughout the courtyard covered seating areas.

r. courtyard space.

s. Civil, Landscaping, Electrical, and Telecom requirements are identified in Attachments B-7, B-8, and B-15.

10. Sports Facilities

a. Provide a combined football/soccer field with a perimeter 8-lane running track, press box, restrooms, storage, and fixed spectator seating.

b. Provide an outdoor scoreboard that can be viewed from the press box and spectator seating.

c. Provide track and field provisions for long jump, triple jump, shot put, discus, and javelin throw.

d. Provide alternating lane colors for the running track.

e. Provide a 4-ft fence with access gates along the track perimeter to protect the track from excessive pedestrian traffic.

f. Provide a separate practice field near the football/soccer field.

g. Provide 4 tennis courts with spectator seating.

h. Provide a multipurpose baseball/softball/soccer field that will be shared by SSHS and FBLG schools.

i. Provide fixed spectator seating, backstops, and dugouts for the multipurpose baseball and softball fields.

j. Provide portable bleachers for the multipurpose soccer field.

k. Provide field lighting.

11. General Requirements for Building Design

a. Do not exceed a second-floor level.

b. Provide Access-controlled entry with egress override at exterior building doors.

c. Provide ADA door operator controls at primary building entrances.

d. Provide a minimum of two passenger elevators and one service elevator for 2nd floor access.

e. Provide Security Surveillance and Alarm systems.

f. Provide seismic separation as established in the programming document design.

g. Provide roof access and fall protection.

h. Provide gravel maintenance strips at perimeter of buildings.

i. Comply with Guam Zoning Code; International Building Code 2009; Guam Tropical Energy Code; ADA/ANSI A117.1-2003; Department of Public Health and Social Services requirements for school facilities; National Federation of High Schools standards for sports facilities.

j. Refer to Part I and J requirements.

12. Corridors

a. Minimize hiding spots in corridors.

b. Locate general student lockers in classroom building corridors.

c. Provide Access Control for exterior doors

13. Artwork

a. Provide Local Artist murals/artwork/embroidered banners/flags at building entrances; the fence structure along the east side of the campus adjacent to the community walking path; offices; conference rooms; cafeteria; auditorium lobby; and library. Refer to Attachment B-16 for CAHA requirements.

14. Room Requirements

a. Provide the rooms specified in the room requirements and adjust accordingly for the student population requirements. Refer to Part J.

15. Room Adjacencies

a. Maintain the general room adjacencies established in the programming document design; design development may modify adjacencies subject to GDOE approval.

16. Campus Wing Configurations

a. Maintain the desired A-wing, B-wing, and C-wing general grouping of spaces established in the programming document design; design development may modify campus wing configurations subject to GDOE approval.

17. Room Area and Dimensions

a. Maintain minimum room areas and dimensions established in the programming document design; design development may modify room area and dimensions subject to GDOE approval.

18. Building Systems Requirements

    a. Refer to Part I.

19. Access Control Requirements

    a. Refer to Part I.

20. Provide a concrete floor structure for Dance/Band/Choir Classrooms if these are located on the second-floor level.

G. Design Development Requirements for Final Construction Documents:

1. Modification of the Programming Document Design is acceptable for:

    a. Site Layout and Courtyard Configuration

    b. Room Configuration & Placement

    c. Building Shell Design

    d. Building Systems Design

    e. FF&E

2. Modifications must comply with the Programming Document Design intent and are subject to GDOE approval.

H. Site Development Requirements

1. Civil – Refer to Attachment B-15

2. Landscaping – Refer to Attachment B-15

3. Site Fire Protection – Refer to Attachment B-15

4. Site Electrical & Telecom – Refer to Attachment B-15

I. Building Shell & Systems Requirements

1. Architectural

    a. Exterior Sidewalks
        1) Provide sealer and broom finish concrete for Exterior Sidewalks with pattern as identified in the programming document design.

    b. Slab on Grade
        1) Provide termite treatment.
        2) Provide continuous vapor barrier at building perimeter foundations and slab on grade for interior spaces.
        3) Provide floor mats with drains at building entrances.
        4) Provide ADA-compliant floor transitions and maintain required tolerances for floor finishes.

c. Exterior Walls & Columns
    1) Provide plaster and paint finish for concrete walls and columns.
    2) Provide reveal and paint patterns per the programming document design.
    3) Provide beveled edges and corners.
    4) Flash and seal wall penetrations.
    5) Provide eyebrows/overhangs for exterior windows and doors.
    6) Provide aluminum or stainless steel seismic joint covering with weatherproofing.
    7) Provide aluminum or stainless-steel wall coping.
    8) Provide aluminum or stainless-steel roof drain cladding.

d. Suspended Slabs & Roofs
    1) Provide gutters and downspouts for balcony walkways and roofs.
    2) Provide roof drains with covers.
    3) Provide scuppers for drainage and overflow.
    4) Provide aluminum or stainless steel seismic joint covering with weatherproofing.
    5) Provide floor mats with drains at building entrances.
    6) Provide integrated rain drips at the bottom face of the exposed structure for balcony walkways and roofs.
    7) Provide sealer and broom finish for balcony walkways.
    8) Provide monolithic concrete connection of roof slab to parapet wall.
    9) Provide control joints at roofs to mitigate roof cracks.
    10) Provide continuous roof coating with flexible flashing at control joints, wall-roof transitions, penetrations, and elevation changes.
    11) Provide fireproofing for exposed steel structure where fire rating is required.
    12) Provide thermal insulation under the roofs of interior spaces.
    13) Provide acoustic insulation for the Dance, Choir, and Band rooms on the second floor above other rooms.

e. Exterior Doors & Windows
    1) Comply with wind loading requirements and standard testing requirements.
    2) Provide aluminum storefront and flush entrance doors to interior spaces; full lite doors for primary building entrances; flush doors with vision panels for other exterior doors; no vision panels at restroom doors.
    3) Provide aluminum storefront windows.
    4) Provide exterior doors with thresholds, and complete aluminum and rubber weatherstripping.
    5) Provide operable windows with screens at classrooms and offices
    6) Provide air curtains at designated doors.
    7) Provide ADA door operator systems at primary entrance doors.
    8) Provide access-control systems at exterior entrance doors excluding restrooms and utility rooms accessed from the main courtyard space.
    9) Provide aluminum accordion shutters for storefront doors and windows.

10) Provide clearstory windows for the library reading room, cafeteria dining area, and classroom building second floor corridors.
11) Provide tinted safety glass for doors and windows.
12) Comply with room requirements for exterior doors & windows.

f. Roof Access, Fall Protection, and Stairs
   1) Provide secure roof access stairs.
   2) Provide secure roof access ladders with fall protection.
   3) Provide parapet walls or guardrails for roofs.
   4) Provide fall protection system anchors without parapet walls or guardrails.
   5) Provide aluminum guardrails with handrails at stairways.
   6) Provide aluminum guardrails for balcony walkways and fall protection.

g. Interior Walls and Columns
   1) Provide plaster and paint finish for exposed concrete walls and columns.
   2) Provide gypsum board wall partitions and furring with light gauge metal framing; comply with fire resistance requirements.
   3) Provide cement backer board wall partitions with light gauge metal framing for walls receiving tile finish.
   4) Provide wood blocking and additional framing support where other work or equipment is attached to wall partitions.
   5) Provide acoustic insulation at wall partitions; use water and mold resistant insulation at plumbing walls and furring for exterior walls.
   6) Provide paint patterns per the programming document design.
   7) Provide rubber base for interior walls except for rooms with ceramic tile floor or wall finish.
   8) Comply with room requirements for interior walls and FF&E.

h. Interior Floor Finishes
   1) Provide VCT flooring for interior spaces except where otherwise required.
   2) Provide Rubber tile flooring for the Cafeteria dining area,
   3) Provide fluid-applied Athletic Flooring at the Gymnasium and Track.
   4) Provide Performance Flooring for the Dance, Band, and Choir Rooms.
   5) Provide porcelain ceramic wall and floor finish at restrooms.
   6) Provide quarry tile floor finish at Kitchen areas.
   7) Comply with room requirements for finishes.

i. Ceilings
   1) Provide 2’x2’ acoustical ceiling tile system. Gyp. Bd. Soffits may be utilized for concealing mechanical ductwork.
   2) Provide 2’x2’ smooth ceiling panels for the cafeteria and kitchen areas.
   3) Provide water-resistant gypsum board for soffits and roof furring.
   4) Provide ceiling access panels for maintenance requirements.
   5) Provide acoustic ceiling elements per room requirements.
   6) Provide seismic bracing for ceilings and soffits.
   7) Comply with room requirements for ceiling height.

j. Interior Doors & Windows
   1) Provide full lite doors at corridors.
   2) Provide flush wood doors with vision panels at classroom/prep room entrance and storage doors.
   3) Provide flush wood doors with no vision panels at corridor restroom entrances. Provide double-keyed deadbolts for multiple-occupant restrooms. Provide privacy function locksets for single-occupant and family restrooms.
   4) Provide clear safety glass for doors and windows.
   5) Provide exit devices per egress requirements.
   6) Provide window blinds except at clearstory windows
   7) Provide acoustic windows and doors per room requirements.

k. Toilet Partitions & Accessories
   1) Provide phenolic toilet partitions.
   2) Provide shower partitions and curtains to separate each individual shower.
   3) Provide toilet accessories for restrooms.
   4) Comply with DPHSS requirements.

l. Casework
   1) Provide ¾-inch plywood with hardwood edges, wood veneer, and plastic laminate finish casework with adjustable shelving.
   2) Provide epoxy resin countertops on ¾-inch plywood with backsplash at science and art classrooms.
   3) Provide solid surface countertop on ¾-inch plywood with backsplash at sink counters.
   4) Provide power, water, and LP gas connections and fixtures for science tables.
   5) Match casework base with wall base.
   6) Provide pipe insulation for exposed piping at accessible sinks and lavatories.

m. Signage
   1) Provide Exterior Building Signage designating each wing/building and visible from the emergency access road.
   2) Provide exterior signage for each wing/building that is visible from the courtyard.
   3) Provide Exterior Signage for each wing/building at each building entrance.
   4) Provide room signage indicating room number and name; include Braille.
   5) Provide directional signage for exits, restrooms, main office, cafeteria, gymnasium, band, choir, dance, and library.

2. Structural Requirements – Refer to Attachment B-15

3. Mechanical & Fire Protection Requirements – Refer to Attachment B-15

4. Electrical Power & Lighting – Refer to Attachment B-15

    a. Refer to access control requirements for the Courtyard, Main Entry, and building exterior doors.

5. Telecommunications – Refer to Attachment B-15

    a. Provide a combined Public Address, Intercom, and Bell system throughout the entire school for notifications to the classrooms, offices, corridors, covered walkways, library, multipurpose, cafeteria, auditorium, and gymnasium spaces. Provide intercom controls at each classroom, library, cafeteria office, gymnasium offices, and auditorium office/control room for 2-way communication to the PA control center at the Main Office.

J. Commissioning Requirements

1. Refer to Attachment B-8 Specifications Section 01910 General Commissioning Requirements.

K. Insurance and Capital Maintenance and Custodial Plan Requirements

Insurance

After the winning offeror takes occupancy of the Project, the offeror shall, in accordance with the Insurance and Maintenance Agreement, but solely from amounts available for such purpose in the Insurance and Maintenance Fund, at all times maintain or cause to be maintained with responsible insurers that are, at the time of obtaining each policy and on each policy renewal date, rated in an investment grade category (BBB- or equivalent and higher) by one or more nationally-recognized rating agencies, all such insurance on the Project (valued as defined below) which is required under the Trust Agreement or is customarily maintained with respect to properties of like character against accident to, loss of or damage to such properties. Notwithstanding the generality of the foregoing, the Offeror shall not be required to maintain or cause to be maintained any insurance which is not available from reputable insurers in the open market or more insurance than is specifically referred to below.

Subject to the preceding paragraph, the Proposer shall:

1. Keep or cause to be kept a policy or policies of insurance against loss or damage to the Project resulting from fire, lightning, vandalism, malicious mischief, riot and civil commotion and such perils ordinarily defined as “extended coverage” and other perils as the government may agree should be insured against in forms and in amounts which the offeror shall deem advisable or necessary to protect its interests. Such insurance may be carried in conjunction with any other fire and extended coverage insurance carried or required to be carried by the government. Such insurance shall be maintained in an amount not less than the full insurable value of the Project, subject to deductible conditions acceptable to the government. The term “full insurable value” as used in this subsection means an amount at least equal to the lesser of (i) the then-current replacement value of the Facility, or (ii) the aggregate principal amount represented by the then-outstanding Certificates plus one-half of the aggregate interest represented by the

then-outstanding Certificates and payable during the next Fiscal Year. Said "full insurable value" shall be determined from time to time but not less frequently than once in every twelve (12) months.

2. Maintain or cause to be maintained public liability insurance against claims for bodily injury or death, or damage to property occurring upon, in or about the Facility for the Site, such insurance to afford protection to a limit of not less than $1,000,000 for a single occurrence. Such insurance shall be maintained in sound insurance companies that comply with statutory insurance requirements. Such insurance may be carried in conjunction with any other liability insurance coverage carried or required to be carried by the Lessee.

3. Maintain or cause to be maintained earthquake and windstorm insurance for the Simon Sanchez High School Facility.

4. Maintain or cause to be maintained flood insurance for any portion of the Project located in a flood plain.

All Insurance herein provided for shall be affected under policies issued by insurers of recognized responsibility, licensed or permitted to do business in Guam, that arc, at the time of obtaining each policy and on each policy renewal date, rated in an investment grade category (BBB- or equivalent and higher) by one or more nationally recognized rating agencies, except as otherwise hereinafter provided. As an alternative to the requirement of subsections (i), (ii), (iii) and (iv), the offeror may insure such property to the same extent under a blanket insurance policy or policies which cover not only such property but other properties.

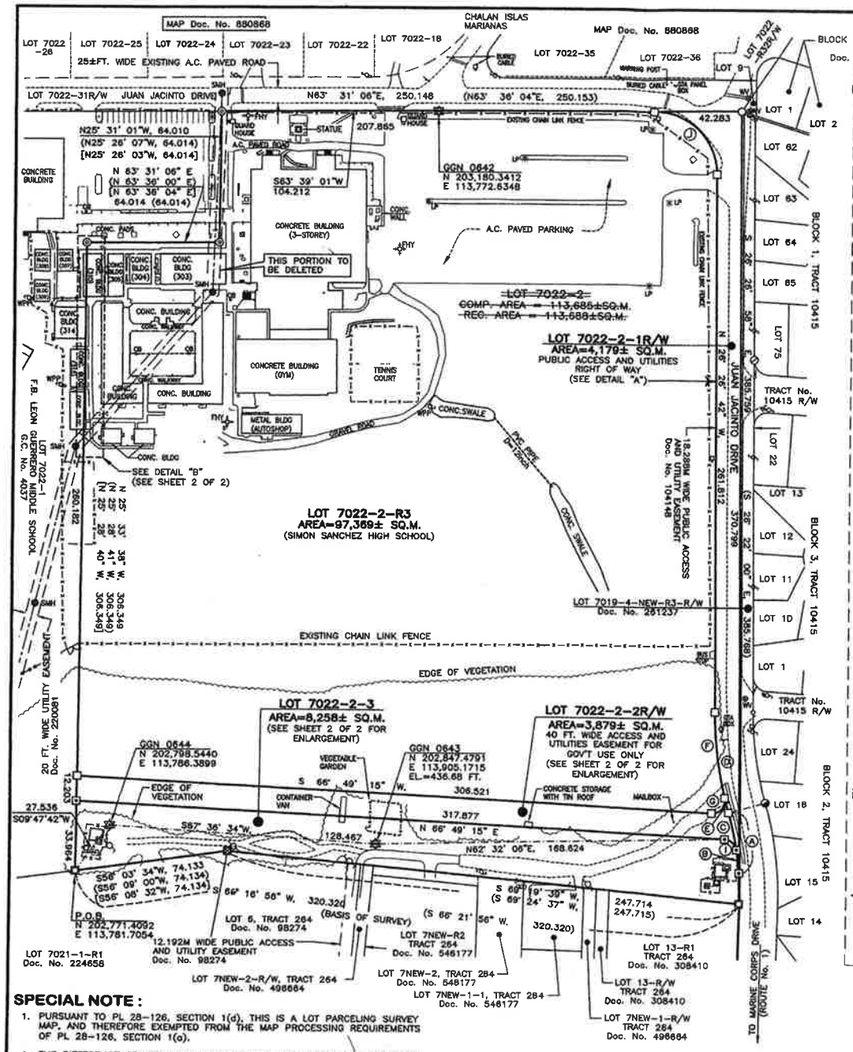
All policies or certificates issued by the respective insurers for insurance shall provide that such policies or certificates shall not be cancelled or materially changed without at least thirty (30) days prior written notice to the government. All policies or certificates issued by the respective insurers for insurance shall also require the insurer to give the government notice of the non-payment of the premium and shall give the government a reasonable opportunity to cure such non-payment. Certificates of insurance listing such policies shall be deposited with the Trustee together with appropriate evidence of payment of the premiums therefor, and, at least thirty (30) days prior to expiration dates of expiring policies or contracts held by the Trustee, copies of renewal or new policies or contracts or certificates shall be deposited with the government together with evidence of payment of premiums therefor.

All policies of insurance shall provide that the government is an additional insured, provided, that all policies of insurance (except the policy of public liability specified in Section 7.01(b)(ii)) shall also provide that the proceeds thereof shall be payable to the Lessor. The Net Proceeds of fire and extended coverage insurance shall be deposited into the Insurance and Maintenance Fund under the Trust Agreement to be applied to rebuild and repair the Facility or into the Redemption Fund under the Trust Agreement to be applied to prepay outstanding Certificates as provided in Article X, as determined by the offeror in consultation with the government.

Capital Maintenance and Custodial Plan

Post Construction Facilities Maintenance and Custodial Operations Plan - The design team shall prepare a complete operation manual for the school for the required post construction monitoring, maintenance, and custodial operations of the school facility. The plan shall address the operational and/or maintenance of the buildings, equipment, landscaping, the drainage system, all outdoor facilities, and for any facility appurtenances for the proper operation of the school.

The Maintenance Contractor will then prepare an annual budget to address the facilities annual custodial, grounds and maintenance & repair as a separate cost to the construction financing. Additionally, this budget will include a capital maintenance fund to fund all replacement equipment as highlighted in the attached "30 Year Maintenance Program" Work Scope.



The building maintenance and custodial services phases shall commence upon acceptance of the school and shall continue for a period of thirty (30) years or until the leaseback contract is completed. Routine maintenance, repair and upkeep shall be the responsibility of the Contractor, as provided by the terms of the Insurance, Maintenance Agreement. Building maintenance includes the preventive maintenance of the whole facility, and the replacement of all fixed equipment. Custodial services include all janitorial services, ground maintenance, and trash disposal.

30 Year Maintenance Program			Type			
	Typical School Facility Components for Maintenance	Frequency	Janitorial	Preventive	Unscheduled	Capital
1	**Paving**					
1.1	Asphalt - repair/seal of cracks	As required			x	
1.2	Concrete Slabs on Grade and Elevated Slabs - repair cracks	As required			x	
2	**Structural**					
2.1	Structural Damage Assessments	As required			x	
2.2	Foundation Repairs	As required			x	
2.3	Repair of Structural Elements (incl. Crack Repairs)	As required			x	
2.4	Replacement of Structural Elements	As required			x	
2.5	Upgrading of Structural Elements	As required			x	
3	**Wall Systems**					
3.1	Doors including hardware	As required				x
3.2	Window Assemblies (including Aluminum Sash)	As required			x	x
3.3	Indoor Gym Bleachers that pull out from wall	As required		x		
3.4	Restroom Partitions (attached to wall)	As required			x	
4	**Floor Covering**					
4.1	Carpeting	Daily	x		x	x
4.2	Resilient Tile Flooring	Daily / Weekly	x		x	x
4.3	Sports Flooring	Daily / weekly	x		x	x
5	**Painting**					
5.1	Interior of classrooms, library, Offices, hallways, cafeteria, Restrooms, Gymnasium and Athletic Manager's Office, Covered Walkways, Laboratories and other Indoor and Outdoor Spaces.	As required / 5-years			x	x
5.2	Touch-up painting of walls	Monthly	x			
5.3	Exterior masonry, metal surfaces and trim	As required / 5-years			x	x
6	**Roofing**					
6.1	Large Sections or Whole Buildings of Roofing Systems including Water and Thermal Proofing	As required / 5-years			x	x
6.2	Flashings, Gutters, and Downspouts	As required		x	x	
6.3	Ceiling Tiles	As required			x	
7	**Electrical**					
7.1	Main Electrical Riser, Connections and Conduits within the Boundaries	As required		x	x	
7.2	Panels and Boards	As required		x	x	
7.3	Signal Systems, including Fire Alarm System and Public Address	Per Mfr		x		
7.4	Main Power Distribution System	As required			x	
7.5	Interior and Exterior Power Distribution Systems	As required			x	
7.6	Interior and Exterior Ligthing Systems including Interior and Exterior Incandescent and Flourecent Lighting and Fixtures	Monthly	x	x		
7.7	Equipment Connections	As required			x	
7.8	Condits, Consductors and Cables	As required			x	
7.9	Preventive Maintenance and Repair of Stand By Generator and Transfer Switch	Per Mfr		x	x	
8	**Plumbing**					
8.1	Main Water Supply Pipe Connections and Piping Within Boundaries	As required			x	
8.2	UndergroundWater Distribution Systems	As required			x	
8.3	Sewer piping, manholes within boundaries	As required			x	
8.4	Interior Water Supply	As required			x	
8.5	Interior and Exterior Plumbing, Connections, Piping and Fixtures, including heaters	As required / Per Mfr		x	x	x

30 Year Maintenance Program			Type			
	Typical School Facility Components for Maintenance	Frequency	Janitorial	Preventive	Unscheduled	Capital
9	**Air Conditioning/Ventilation/Heating**					
9.1	Air Conditioning Systems					
9.1.1	1.a Central Syatems	wk, mo, qrtr, 5-yr	x	x		x
9.1.2	1.b Individual Units	wk, mo, qrtr, 5-yr	x	x		x
9.2	2. Ventilation Systems					
9.2.1	2.a Toilet and Bath Fan Exhaust Systems	wk, mo, qrtr, 5-yr	x	x		x
9.2.2	2.b Cafeteria and Kitchen Fan Exhaust Systems	wk, mo, qrtr, 5-yr	x	x		x
9.1.3	2.c Construction and Automotive Workshops Fume Exhaust Systems	wk, mo, qrtr, 5-yr	x	x		x
10	**Fire Protection System**					
10.1	Testing and Certifying of Fire Protection System	Annualy		x		
10.2	Maintenance of Fire Protection Riser and System	As required			x	
10.3	Maintenance of Fire Alarm System	see Section 7				
10.4	Testing and Certifying of Kitchen Fire Protection System				x	
10.5	Certification and Replacement of Fire Extiguishers	Annualy/As Required		x	x	x
11	**Kitchen Equipment**					
11.1	Kitchen Equipment Maintenance	Weekly/As Required			x	x
12	**Telecom and Internet**					
12.1	Telecommunication Conduits / wiring	As Required			x	
12.2	Public Address	Per Mfr		x		
13	**Landscaping and Lawns**					
13.1	Grass cutting and maintain all grounds including Sports field	Bi-weekly	x			
13.2	Walkway edging	Bi-weekly	x			
13.3	Tree Trimming / Hedging	Monthly	x			
13.4	Provide and maintain Necessary Lawn Care Equipment (1- Riding Mower, 4-Bush cutters, 2-push Mowers)	As Required		x		x
14	**Custodial and Waste Collection**					
14.1	Garbage collection from classrooms, offices, restrooms and other building areas	Daily	x			
14.2	Site cleanup (hallways, walkways, parking lots, etc.)	Daily	x			
14.3	Waste removal by commercial hauler	Daily	x			
14.4	Classroom Floor polishing / waxing / sealing	Bi-Quarterly	x			
14.5	Restroom cleaning (Sweeping, mopping, wipedown of surfaces, Supply and replenishment of Paper Products, Soap)	Daily	x			
14.6	Restroom flushing and rinsing	Daily	x			
14.7	Classroom cleaning (Sweeping, mopping, wipedown of Student Desks, Cleaning of White boards	Daily	x			
14.8	Cleaning of Windows and doors interior and exterior	Daily	x			
14.9	Flushing exterior walkways / pressure washing	Bi-weekly / Quarterly	x			
15	**Pest Control**					
15.1	Spraying for control of pests(Ants, Cockroaches and Rats)	As Required	x			
15.2	Control of Termites	As Required	x			x
16	**Elevator Maintenance**					
16.1	Certification	annualy		x		x
17	**Campus Security**					
17.1	On Site Secrity	As Required	x			

(end)

JULY 2022

EXECUTIVE SUMMARY

Guam Department of Education (GDOE) is proposing to construct a new high school facility on the parcel containing the existing Simon Sanchez High School (SSHS) campus, with supporting facilities proposed on the adjacent F.B. Leon Guerrero (FBLG) Middle School parcel. Duenas, Camacho & Associates, Inc. (DCA) is part of an architectural and engineering design team led by Taniguchi Ruth Makio Architects that is tasked by GDOE with the initial surveying, design, and engineering work. The new school facility will be constructed, financed, and built by a single contractor in two phases.

The project site is located in Yigo on Lot Nos. 7022-2-R3 and 7022-1. Lot 7022-2-R3 is a 97,369 sq. m (24-acre) parcel that encompasses the existing SSHS campus. Lot 7022-1 is an approximately 94,607 sq. m (23-acre) parcel adjacent and west of Lot 7022-2-R3. The northern portion of Lot 7022-1 contains the FBLG campus; however, only the southern portion (approximately 10 acres) is included in the action area. The western boundary of Lot 7022-1 abuts Lot 10119-20-R/W (a 50-foot-wide public access and utility right-of-way) and Lot 10119-17, which contains Well Y-14, a Guam Waterworks Authority (GWA) production well. The southern boundary of Lot 7022-2-R3 abuts a 40-foot-wide access and utilities easement (Lot 7022-2-2R/W). Adjacent and south of this easement is Lot 7022-2-3, which contains two GWA water production wells (Wells Y-5 and Y-6).

This Biological Assessment (BA), prepared by DCA, a non-federal consultant, assesses the effects of the proposed construction of the new high school on federally-protected species or their designated critical habitat in compliance with Section 7(c) of the Endangered Species Act (ESA) of 1973, as amended. Visual pedestrian surveys for locally and federally-listed threatened or endangered species within the SSHS action area were conducted by DCA biologists in October 2020, March 2021, and March 2022. The surveys documented a colony of the ESA-listed endangered Guam tree snail (*Partula radiolata*) that spans the southern sectors of Lot Nos. 7022-2-R3 and 7022-1.

We have determined that with the implementation of conservation measures described in this BA, the proposed action may affect, but is not likely to adversely affect the locally-listed and ESA-listed Guam tree snail (*Partula radiolata*), and the humped tree snail (*Partula gibba*) and fragile tree snail (*Samoana fragilis*) if present. We have also determined that this project will have "no effect" on the following ESA-listed threatened plant species because these species do not occur in the action area based on the 2021 and 2022 pedestrian surveys: wild onion (*Bulbophyllum guamense*), *Dendrobium guamense,* and *Tuberolabium guamense*. Given the absence of sightings during 2021 and 2022 surveys, and the implementation of conservation measures described in this BA, we have determined that the proposed action may affect, but is not likely to adversely affect the locally-listed and ESA-listed Mariana fruit bat (*Pteropus mariannus mariannus*). Additionally, because of approximately seven miles of spatial separation,

we have determined that the SSHS project will have no effect on designated critical habitat for the Mariana fruit bat.

Much of Lot 7022-2-R3 has been cleared and developed for the existing high school facilities. A narrow strip of scrub forest (about 4.01 acres) south of this cleared land remains along the length of the southern parcel boundary. Additionally, of the 10 acres of Lot 7022-1 included in the project area, 0.18 acres are scrub/shrub, and 8.62 acres are scrub forest. The plant community contains native limestone forest components, such as seeded breadfruit or dokdok (*Artocarpus mariannensis*) trees and beyuko halomtano' or false rattan (*Flagellaria indica)* vines. Native pago or sea hibiscus (*Taliparitі tiliaceum*) and introduced tangantangan (*Leucaena leucocephala*) are common scrub forest trees, along with the occasional kafu' or screwpine (Pandanus tectorius) trees. Common birds such as the Philippine collared dove (*Streptopelia dusumieri*) and the Migratory Bird Treaty Act (MBTA) listed yellow bittern (*Ixobrychus sinensis*) were observed flying overhead and resting on tangantangan. Black drongos (*Dicurus macrocercus*) were frequently spotted flying low throughout the open field within the fenced confines of FBLG and SSHS or resting on ironwood trees. Other bird sightings included the MBTA-listed white tern (*Gygis alba*) and Pacific golden plover (*Pluvialis fulva*). The white tern (*G. alba*) was observed flying throughout the southern sector of the project site and resting on an ironwood (*Casuarina equisetifolia)* tree. In contrast, Pacific golden plovers (*P. fulva*) were observed throughout the open, grassy fields south of both campuses. The following non-listed fauna were either observed directly, or signs of their presence were detected throughout the project site: feral pig (*Sus scrofa*), skinks (*Emoia caeruleocauda* and *Carlia ailanpalai*), snails (*Drymaeus multilineatus* and *Satsuma succincta*), dogs (*Canis lupus familiaris*), chickens (*Gallus gallus domesticus*), spiders (*Heteropoda venatoria*) and monitor lizards (*Varanus tsukamotoi*).

1 INTRODUCTION

The purpose of this Biological Assessment (BA) is to assess the effects of the proposed construction of a new Simon Sanchez High School facility in Lot Nos. 7022-2-R3 and 7022-1, Yigo, Guam, on federally-protected species or their designated critical habitat. This BA, prepared by Duenas, Camacho, and Associates, Inc. (DCA), a non-federal consultant, addresses the proposed action in compliance with Section 7(c) of the Endangered Species Act (ESA) of 1973, as amended. Section 7 of the ESA assures that, through consultation (or conferencing for proposed species) with the National Marine Fisheries Service (NMFS) and/or the U.S. Fish and Wildlife Service (USFWS), federal actions do not jeopardize the continued existence of any threatened, endangered or proposed species, or result in the destruction or adverse modification of critical habitat.

1.1 Summary of Proposed Action

GDOE is planning to construct a new school facility south of the existing Simon Sanchez High School in Lot 7022-2-R3, as well as on the southern portion of Lot 7022-1 in Yigo, Guam.

All activities will occur on non-federal, Government of Guam-owned property. The project will be funded and built by a single contractor, who would need to seek coverage under the U.S. Environmental Protection Agency (USEPA) National Pollutant Discharge Elimination System (NPDES) 2022 Construction General Permit (CGP). The 2022 CGP took effect on February 17th, 2022, replacing the 2017 CGP. Coordination between USEPA and USFWS is part of the interagency consultation process for this permit.

1.2 Coordination History

DCA initiated informal coordination via email on October 30, 2020, with Ms. Jacqueline Flores of the USFWS Guam Office by requesting a list of any federally-listed species or proposed critical habitat that may be present within the project area. Ms. Lauren Taylor, Fish and Wildlife Biologist, assigned the project Reference No. 01EPIFOO-2021-SL-0043, and issued a species list on December 2, 2020 (Appendix D).

2 BACKGROUND AND PROJECT DESCRIPTION

2.1 Project Description

Guam Department of Education (GDOE) is proposing to construct a new high school facility on the campus of the existing Simon Sanchez High School (SSHS). Duenas, Camacho & Associates, Inc. (DCA) is part of an architectural and engineering design team led by Taniguchi Ruth Makio Architects (TRMA) that is tasked by GDOE with the initial surveying, design, and engineering work. The new school facility will be constructed, financed, and built by a single contractor in two phases. Phase 1 would construct the main campus buildings, parking spaces and a 60,000 square foot stormwater ponding basin. Phase 2 would construct a multipurpose field and other amenities.

The project site is located on Lot Nos. 7022-2-R3 and 7022-1 Yigo, Guam. The property survey map is enclosed in Appendix E. Lot 7022-2-R3 is a 97,369 sq. m (24-acre) parcel, which encompasses the existing SSHS campus. All of the new campus classrooms, parking spaces and supporting facilities will be constructed in this parcel. Lot 7022-1 is an approximately 94,607 sq. m (23-acre) parcel situated adjacent and west of Lot 7022-2-R3. Since the northern portion of Lot 7022-1 contains the F.B. Leon Guerrero (FBLG) Middle School campus, the project will utilize much of the southern portion (approximately 10 acres) of the lot. These uses include new stormwater infrastructure (Phase 1) and a new multipurpose sports field (Phase 2).

The eastern project boundary abuts Lot 7022-2-1R/W, a public access and utilities right-of-way that encompasses a portion of Juan Jacinto Street; this street is the nearest paved vehicle access to the project site. The southern project boundary abuts Lot 7022-2-2R/W, a 40-foot-wide access and utilities easement. Adjacent and to the south of this easement is Lot 7022-2-3, which contains two Guam Waterworks Authority (GWA) water production wells (Wells Y-5 and Y-6). The western property boundary of Lot 7022-1 abuts Lot 10119-20-R/W, a 50-foot-wide public access and utility right-of-way, and Lot 10119-17 containing GWA production Well Y-14 (Appendix A). Located east of the property is GHURA 506 housing, to the west are Ypaopao Estates and GHURA 505, and to the north of the property is the University of Guam's Triton Farm.

Construction of the new high school campus is anticipated to involve an excavator equipped with a bucket for clearing and grading activities such as the removal of debris and excavated material from vegetated areas; dump trucks to haul equipment to and from the site as well as for the removal of green waste; and equipment (cement trucks, hoses and chutes, motor grader) to pave and surface the parking spaces and roadways. Designated areas for staging/stockpiling materials and/or equipment maintenance/storage have not yet been identified by the Contractor but would be located within the project site. If additional staging areas beyond the project site are

necessary, these areas would be subject to site selection restrictions, and the conservation/impact mitigation measures described below and summarized in Table 3 of Section 5 Effects Analysis.

2.2 Physical Conditions

2.2.1 Topography

The SSHS project site is generally on relatively flat terrain with an elevation range between 432 and 446 feet around the perimeter of the Lot 7022-R3 boundary (Appendix A, Figure 3). However, Lot 7022-1 contains low berms along its western and southwestern boundaries that consist of mostly anthropogenic metallic and household waste. Earthen berms are also located within the southwestern sector of Lot 7022-1 where existing stormwater runoff water flows. Additional earthen berms as well as a pile of large rocks were found centered in the southwestern sector of this parcel. No sinkholes were encountered during the recent survey, nor are there any depicted on the ground survey map (Appendix A, Figure 3) or U.S. Geological Survey Map (Figure 1) (USGS, 2000).

2.2.2 Soils

One soil type has been mapped in the SSHS site by the United States Department of Agriculture (USDA) Natural Resources Conservation Service (2014). Guam cobbly clay loam, 3 to 7 percent slopes, dominates the entire project site. The soil is shallow, with a depth to limestone ranging from 5 to 41 cm. It is a well-drained soil on limestone plateaus characterized by a dark reddish brown surface layer of cobbly clay loam. The permeability of Guam cobbly clay loam is moderately rapid and the available water capacity is very low. The soil has slow runoff characteristics and a slight hazard of water erosion (Young, 1988).

2.3 Project Timeline

Construction of the new SSHS facility would commence upon receipt of all required permits and clearances, including coverage under the NPDES Construction General Permit. Phase 1 Construction is anticipated to take 2 years. Phase 2 Construction is anticipated to take 1 year.

2.4 Conservation Measures

The following conservation measures and best management practices (BMPs) have been developed that will be implemented by GDOE and its contractor to reduce or eliminate potential impacts on MBTA-listed and ESA-listed species and their habitats. For the purpose of this BA, a qualified biologist is an individual who possesses a degree in Biology or related Environmental Science; who has at least two years of experience in conducting natural resource surveys and identifying ESA-listed species and habitats specific to Guam; and who is familiar with the laws and regulations that govern these species. The GDOE biological monitor is defined by the same qualifications as the qualified biologist. The GDOE biological monitor is hired by a contract and is bound by the requirements specified in the contract.

1) TREE SNAIL CONSERVATION MEASURES. One colony of the locally and federally-protected Guam tree snail (*Partula radiolata*) was observed in the central sector of the southern forested sector of the project area. The following measures specific to Guam tree snail, humped tree snail (*Partula gibba*), and fragile tree snail (*Samoana fragilis*) protection would be implemented by GDOE and their contractor during construction of the new SSHS campus project:

   a. PRE-CONSTRUCTION SURVEYS. Potential habitat for ESA-listed tree snails generally includes broad-leaved epiphytic and terrestrial plant species. Since tree snails are mobile and cryptic, one week prior to the commencement of vegetation removal or construction activities in the vicinity of all potential tree snail habitat, a qualified biologist or GDOE biological monitor would conduct a survey to reconfirm the colony boundary of ESA-listed tree snails (Partulidae). If a protected snail species is detected outside of the original established colony boundary, a Designated Responsible Person (DRP) will notify the GDOE Construction Manager, who will contact the USFWS and Guam Department of Agriculture for further technical assistance and guidance.

   b. PERMANENT DUST BARRIER/ SECURITY FENCE INSTALLATION. Prior to the commencement of construction activities within a 23 m (75-foot) distance of known occupied tree snail habitat, the Contractor would install a permanent security fence around the snail colony buffer prior to construction. The fence would be designed to deter unauthorized persons from accessing and disturbing the protected snail habitat. The fence would incorporate a permanent dust barrier. This dust barrier may be similar to the existing barrier at the Mangilao Solar Farm (Photo 1), and would effectively prevent dust and wind exposure from affecting the colony. The dust barrier would be of sufficient height to shield the occupied snail habitat from fugitive dust, based on the height of the habitat and potential for dust generation by the construction activity. The barriers would be installed such that they would not damage the nearby buffer vegetation. The dust barrier would be maintained by the Contractor throughout the duration of construction activities that occur within a 23 m (75-foot) radius of the occupied tree snail habitat. A biological monitor would be present during the installation of the barrier before construction commences. Once the barrier is installed, regular inspections of the barrier would be performed by the Contractor's DRP to ensure it is intact and functioning as intended. Prior to commencing work within 23 m (75 feet) of ESA-listed tree snail

Photo 1. Dust barrier and security fence along occupied tree snail habitat in Mangilao, Guam. Source: C. Camacho, DCA.

occupied areas, the Contractor shall coordinate with the USFWS and Guam Division of Aquatic and Wildlife Resources (DAWR) staff. USFWS and DAWR staff will be provided 48-hour notice prior to work and be afforded an opportunity to inspect the installed tree snail protection measures.

c. ESTABLISHMENT OF BUFFER VEGETATION. The USFWS recommended buffer zone for ESA-listed tree snails is 200 feet (61 meters) (Personal communication, Toni Mizerek, USFWS, December 29, 2017). A buffer of up to 75 feet (23 meters) is proposed around the Guam tree snail colony at the locations indicated in Figure 1. The reduction in the size of the buffer will be offset by enhancing the peripheral vegetation, and by installing a permanent artificial dust barrier to supplement the natural buffer vegetation.

   The contractor will first install a permanent dust barrier and security fence approximately 5-10 feet from the buffer zone perimeter depicted in Figure 1. This dust barrier would be tall enough to reduce wind and dust exposure of the colony. Following the installation of the dust barrier, the contractor would plant native trees and shrubs along the perimeter of the buffer to provide a more natural barrier for the colony. This enhancement vegetation would be planted between the dust barrier and scrub forest. With plants of varying heights and thickness, the vegetation will provide a tall, dense natural barrier to enhance the buffer. The dense buffer vegetation may also help to deter unauthorized individuals from accessing the scrub forest, which is a dumping ground for household and other miscellaneous waste.

   The understory of this natural barrier will be planted with plants native to Guam, such as latherleaf or gasoso (*Colubrina asiatica*), lada (*Morinda citrifolia*), and half-flower or nanåso (*Scaevola taccada*). Within the SSHS action area, latherleaf and lada were among the most commonly observed host plants for the Guam tree snail, making these plants ideal candidates for the natural barrier. Nanåso, a large shrub, has been used for landscaping as hedges by hotels and private businesses on the island, and may be ideal for forming the exterior of the natural barrier. Among the suitable mid-story and overstory plants are påhong (*Pandanus dubius*), fago' (*Ochrosia oppositifolia*) and puting (*Barringtonia asiatica*). Påhong is a medium-sized tree whose compact shape would contribute towards blocking wind and dust. Fago', a medium-sized, broad-leaved tree, would be highly suitable habitat for the Guam tree snail (*P. radiolata*) while adding to the height of the forest canopy. Puting, a large tree with a full canopy, would provide the shade and help maintain the humidity needed for tree snail survival.

d. REMOVAL OF TRASH AND DEBRIS. Illegal dumping is rampant in the snail habitat area. Trash and debris also provide refugia for the New Guinea flatworm (*Platydemus*

manokwari). The rubbish would be carefully removed under the supervision of a qualified biologist and properly disposed without disturbing the snail colony habitat.

e. SUPERVISOR AWARENESS TRAINING. Prior to construction activities, the Contractor's DRP shall receive awareness training for ESA-listed tree snails. The Contractor shall schedule this training with the GDOE Construction Manager. Awareness training would be provided to the GDOE Construction Manager and Contractor's DRP by a qualified biologist. When feasible, the qualified biologist will also provide this training to as many of the supervisory staff and site workers as possible. The DRP will be responsible for training the remaining supervisory staff and site workers as they come onto the project. The DRP will also be responsible for performing daily checks for listed species and overseeing the regular maintenance of protection measures at the start of the day, in the areas that will have construction activity that day. The GDOE Construction Manager is tasked to perform periodic checks throughout the duration of the project. Educational materials provided by the qualified biologist will include photographs of target species, contact information, and instructions if ESA-listed species are encountered. These will be posted at the job site for reference for the duration of construction activities.

f. INSTALLATION OF SIGNAGE. Signs labeled "DO NOT ENTER - Endangered Tree Snails Present" will be posted on the exterior of the permanent dust barrier/security fence surrounding the buffer vegetation at the Guam tree snail colony. The signs will be maintained by the Contractor for the duration of construction.

g. MINIMIZATION OF VEGETATION REMOVAL DURING CONSTRUCTION. The contractor will avoid cutting or removing vegetation within the established buffer zone surrounding the known tree snail occurrence to minimize impacts to the snails and their habitat. The Contractor shall not remove any existing vegetation within the buffer zone without the approval of DAWR, and if approved, this would be supervised by the GDOE biological monitor. Workers will remain alert and observant for damage to vegetation within the 23 m (75-foot) wide buffer surrounding the occupied tree snail area, or to the dust barrier. If vegetation is damaged, or the dust barrier is damaged or not functioning as intended, the worker will inform the DRP. The DRP will immediately suspend construction activities in the area until the situation is corrected. If vegetation is damaged, the DRP will inform the GDOE Construction Manager, who will contact USFWS/DAWR. Additionally, the contractor will confine movement of heavy equipment to existing roadways and minimize the generation of dust to the extent practicable. The contractor will also employ sufficient dust suppression measures (such as wetting the soil) as necessary during construction.

h. PROTECTION OF TREE SNAIL HABITAT AFTER CONSTRUCTION. After construction of the SSHS project is completed, the following measures will be implemented by GDOE.

1) **Maintain Permanent Dust Barrier/Security Fence and Signage**. The permanent security fence and barrier installed prior to construction around the buffer zone will be maintained by GDOE so long as the habitat is occupied by the tree snail colony. GDOE will periodically inspect the fence/dust barrier and repair it as needed.

2) **Provide Awareness Training.** All supervisors and site workers at the SSHS campus grounds will be educated on how to identify the Guam tree snail and how to protect occupied snail habitat from potential construction impacts. GDOE will provide a Guam Tree Snail Awareness Presentation to educate all GDOE personnel and subcontractors working at the SSHS campus. New workers will undergo this awareness orientation as they come onto the SSHS campus site.

3) **Maintain Buffer Zone Vegetation and Signage.** The natural barrier installed prior to construction as a buffer zone around the colony will be maintained by GDOE. Maintenance measures include periodically inspecting the barrier, and replanting vegetation as needed to replace dead vegetation and fill in gaps. SSHS students and teachers may also assist with the planting of replacement vegetation within the buffer zone.

4) **Periodically Remove Flatworms and Flatworm Refugia.** GDOE will provide a Guam Tree Snail Awareness Presentation to educate SSHS Science teachers, Science Club student members and club advisors on how to identify the Guam tree snail, protect occupied snail habitat, and how to identify and reduce threats to the Guam tree snail. These trained students and their teachers would periodically inspect the buffer zone and manually remove any New Guinea flatworms (*Platydemus manokwari*) and any artificial debris (such as trash) and natural debris (such as coconuts), which are potential refugia for flatworms. This would provide some basic control measures for the flatworm.

2) MARIANA FRUIT BAT PROTECTION MEASURES. The federally-listed threatened Mariana fruit bat was not detected in the project's construction footprint or adjacent buffer zone; however, there is available scrub forest containing tree species that may potentially support foraging habitat for this species (Appendix A, Figure 4; Appendix C). The following best management practices would be implemented by GDOE and the Contractor to minimize project impacts to the Mariana fruit bat.

a. GDOE and the contractor would minimize alteration or loss of Mariana fruit bat habitat (i.e., scrub forest) at the project site to protect potential roosting, foraging, and breeding sites.

b. GDOE and the contractor would limit exposing bat locations to the public and other contractors to reduce potential poaching of this species. Information on any fruit bat locations would not be shared outside of those persons directly involved in the project, and government regulatory agencies, such as USFWS and Guam Department of Agriculture.

c. Workers will be educated on how to identify the Mariana fruit bat and how to protect occupied fruit bat habitat from potential construction impacts. Prior to the start of work, all workers involved in the project shall participate in the Mariana Fruit Bat Awareness Presentation. The Contractor shall schedule this presentation with the GDOE biological monitor. This special presentation shall be held to educate all the workers. New workers will undergo this awareness orientation as they come onto the job site.

d. The contractor would be required to regularly brief the construction crew to be vigilant for the potential presence of the Mariana fruit bat, and to follow protocols if any bats are detected during construction. These protocols include halting construction immediately, informing a supervisor, and reporting the observation to Guam Department of Agriculture.

e. If a fruit bat is present within 150 m (492 feet) of the project site, the work in that area will be postponed until the bat has left the area voluntarily as confirmed and documented by a biologist. If no bats are detected, construction may commence. Once construction begins, if a fruit bat moves into the project footprint while work is ongoing, the work in that area will be immediately halted and postponed until the bat has voluntarily left the area.

f. If an onsite protected species does not depart the area on its own for three (3) days or more, the contractor will notify GDOE, who will contact the USFWS and Department of Agriculture for further technical assistance and guidance.

g. GDOE would use hooded lighting within 492 feet (150 m) of all potential fruit bat roost habitat.

h. No construction activity would be performed during evening or early morning (pre-dawn) hours. This would minimize the potential for interaction with solitary Mariana

fruit bats, which tend to be more mobile during early morning hours (Wheeler and Aguon, 1978).

3) MIGRATORY BIRD PROTECTION MEASURES. Resident avian species (such as the white tern or yellow bittern) and nonresident avian species (Pacific golden plover) listed as protected under the Migratory Bird Treaty Act (MBTA) (50 CFR Part 10.13) were observed during the biological surveys of the action area. Based on information from the USFWS Office of Migratory Birds, the following conservation measures and beneficial practices would minimize and avoid incidental take of migratory birds.

a) TEMPORAL CONTROLS. Vegetation clearing associated with the construction would be timed to avoid peak nesting of birds, to the extent practicable, to avoid incidentally killing or disturbing nesting birds. White terns (*Gygis alba*) may potentially nest or roost in ironwood (*Casuarina equisetifolia*) trees that exist on the developed open field north of the chain link fence. If timing of construction cannot be altered, then any potential nesting trees, shrubs, or other bird nesting habitat in the footprint of the project would be removed at a time when the birds are not nesting, e.g., well in advance of construction. In order to plan the vegetation removal or other habitat disturbance, consideration will be given to the amount of time that a species of bird needs to complete their nesting effort, from egg laying to fledging, and the activity would be planned far in advance.

b) REMOVAL OF EGGS OR YOUNG. If take cannot be avoided, e.g., birds are actively nesting in trees that are slated for removal and site clearing cannot wait until the young fledge, then DAWR or a permitted rehabilitation facility may be contacted to take the orphaned eggs or young.

c) HAZING. It might also be possible to discourage birds from nesting in trees by hazing, or bothering them in some way to the point that they abandon the site prior to settling in and laying an egg. A similar approach may be taken for ground-nesting and burrow-nesting species, including seabirds. Ground nesting by white terns is uncommon (Birds of the World, 2020b). If a ground-disturbing activity must take place, it would be planned outside the nesting season when possible.

4) SPILL AND DUST CONTROLS. The construction and demolition work would follow the Environmental Protection Plan (EPP) developed for the project and tailored to the specific construction and demolition methods. The EPP measures would control discharges and manage spills from heavy equipment operating at the site. Containment booms and absorbent pads would be readily available on-site for cleaning up lubricant or petroleum spills. The Contractor would implement dust suppression measures during construction, such as wetting down exposed soils as needed to prevent the generation of fugitive dust.

Fill materials, pre-cast structures, and other project-related materials would be staged and stockpiled in upland areas either in the Government property or another upland location arranged by the contractor. No project-related materials would be stockpiled within or in close proximity to habitat occupied by listed species.

5) SEDIMENT CONTROLS. As part of the EPP, the contractor would implement an erosion control and restoration plan to control short-term and long-term erosion and sedimentation effects. Environmental protection measures will be installed and maintained prior to construction or demolition activities. Stormwater protection measures (e.g., sandbags or silt fences) would be installed strategically around the work area and maintained to contain sediments and direct runoff away from occupied habitat during construction. The DRP will be responsible for overseeing the regular maintenance, inspection and determination of BMP effectiveness during construction.

6) SALVAGING OF NATIVE PLANT SPECIES. The proposed action will disturb or remove much of the vegetation (approximately 9.45 acres) within the southern scrub forest of the action area containing native limestone forest components. Within this southern forested area are native vegetation components such as dokdok (*Artocarpus mariannensis*), ifit (*Intsia bijuga*), and vining morinda (*Morinda umbellata*) (Appendix B, Photo 17). Although they are not ESA-listed species, they but are significant due to their role in the ecosystem or Guam's culture. The ifit tree, the Territorial tree of the island, is culturally significant because of its sturdiness and termite resistance, making it an ideal wood to craft furniture. Skilled woodcarvers utilize dokdok trees for crafting items such as canoes. The uncommon vining morinda is listed among the species propagated by the Guam Plant Extinction Prevention Program (GPEPP), a program looking to prevent the extinction of Guam's rarest plant species. Before removing vegetation from the southern scrub forest, the contractor would allow different agencies or interested groups the opportunity to salvage some of these species, so long as these salvage activities occur beyond the buffer zone around the existing Guam tree snail colony.

3 ACTION AREA

The "action area" defines all areas that may be directly or indirectly affected by the proposed action. The limits of construction for the proposed action encompass parcel Lot 7022-2-R3 (24 acres) and much of the southern portion of Lot 7022-1 (approx. 10 acres) (Appendix A, Figures 1 to 3). The action area is approximately 35 acres for this project and encompasses the limits of construction and any areas slightly beyond this limit needed for construction. The action area includes staging areas for materials and equipment within the limits of construction, and the area immediately adjacent to the active worksite where ESA-listed species may be directly or indirectly affected by the noise, dust, and disturbance from construction activities.

4 SPECIES & CRITICAL HABITAT CONSIDERED

4.1 ESA-Listed Species and Critical Habitat

Guam-Listed Threatened and Endangered Species. Thirty-one species, i.e., 11 birds, three mammals, ten reptiles, four mollusks, and three plants, are listed as endangered by the Guam Department of Agriculture under the Endangered Species Act (ESA) of Guam (5 GCA, Section 63205(c)). The Guam tree snail (*Partula radiolata*) or akaleha' and Mariana fruit bat are among the 28 animals listed as endangered under the Guam ESA. No orchid species are currently listed under the Guam ESA; however, the three U.S. ESA-listed orchids found on Guam are Species of Greatest Conservation Need (SOGN) in the latest Guam Wildlife Action Plan (GWAP) (Department of Agriculture, 2019).

Federally-Listed Threatened and Endangered Species. The U.S. Endangered Species Act (ESA) (16 U.S.C. 1531-1544) of 1973, as amended, prohibits the taking of any listed species without prior approval of the Secretary of the Interior.

- **Take** is defined as "to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect or attempt to engage in any such conduct."
- **Harm** is defined as "an act which actually kills or injures wildlife. Such an act may include significant habitat modification or degradation where it actually kills or injures wildlife by significantly impairing essential behavioral patterns, including breeding, feeding, or sheltering."

Prior to 2015, the USFWS previously listed 11 species under the Act as either threatened or endangered for Guam, i.e., two mammals (little Mariana fruit bat and Mariana fruit bat); six birds (Mariana swiftlet, Mariana crow, Guam Micronesian kingfisher, Mariana common moorhen, Guam rail and Guam bridled white-eye); two reptiles (green sea turtle and hawksbill sea turtle); and one plant (hayun lagu). The USFWS rule in October 2015 (80 FR 59424) listed an additional 16 animal species from the Mariana Islands as endangered, and seven plants as threatened under the ESA. Among the newly listed animal species are native tree snails (Partulidae) protected under the Guam ESA. The USFWS species list issued in December 2020 identified 9 plants and 5 animal species that may occur within or pass through the project site (see Appendix D). Based upon this correspondence, the 2015 USFWS ruling, the habitats associated with each listed species, and the habitats identified in the action area, including the absence of native limestone forest, the following Guam and federal ESA-listed species were considered in this BA:

a) threatened epiphytic orchids (Orchidaceae);
b) endangered endemic and indigenous tree snails (Partulidae); and
c) threatened Mariana fruit bat (*Pteropus mariannus mariannus*).

- The orchids ***Bulbophyllum guamense, Dendrobium guamense*** and ***Tuberolabium guamense*** were listed as threatened by the USFWS in 2015 (Federal Register Vol. 80 No. 190 Part IV). All three species are endemic to Guam and certain islands in the Northern Marianas, and are epiphytic on trees in limestone and ravine forest communities. They are threatened by habitat loss and urban development, typhoons, wildland fires, invasive plants and animals, and herbivory by non-native slugs (USFWS, 2009; DAWR, 2018). One *T. guamense*, and fewer than 250 *B. guamense* orchids and 250 *D. guamense* and were known to occur on Guam at the time of the 2015 federal listing (USFWS, 2015). Recent surveys in Northwest Field in northern Guam found nine (9) *D. guamense* and 674 *T. guamense* plants (Demeulanaere et al., 2018).

- The **Guam tree snail (*Partula radiolata*), humped tree snail (*Partula gibba*)** and **fragile tree snail (*Samoana fragilis*)** (Family Partulidae) were listed as endangered by the USFWS in 2015 (Federal Register Vol. 80 No. 190 Part IV), and by the Government of Guam per Guam Endangered Species Regulation No. 6 (5GCA §63205). The Guam tree snail is endemic to and found only on Guam. At the time of their federal listing, the USFWS assumed that there were approximately 26 colonies remaining on Guam (2015). Since the 2015 listing, field surveys have shown there are an estimated 60 sites supporting Guam tree snails on the island, although the species is still considered at risk, according to Dr. Curt Fielder of the University of Guam (Wiese, 2018). The humped tree snail is endemic to Guam and the Northern Mariana Islands. This once abundant species is now limited to a population of about 100 snails in northern Guam (DAWR, 2018). The fragile tree snail is found on just two islands, Rota and Guam; only four small populations have been identified on Guam (DAWR, 2018).

  All three listed tree snail species thrive in cool, shaded and humid forest habitats in which reduced air movement prevents their desiccation (Crampton, 1925). These diminutive snails are threatened by habitat loss, habitat modification by non-native animals, pesticides and by invasive introduced species such as the predatory New Guinea flatworm (*Platydemus manokwari*), and little fire ant (*Wasmannia auropunctata*) (USFWS, 2015; DAWR, 2018). There is no critical habitat designation or recovery plan for any of these tree snail species.

- The **Mariana fruit bat (*Pteropus mariannus mariannus*)**, or fanihi, was listed as endangered on Guam in August 1984 (49 FR 33881 33885). In January 2005, the Mariana fruit bat was reclassified from endangered to threatened on Guam, and listed as threatened throughout its range in the Northern Marianas (70 FR 1190 1210). The biology, habitat, and conservation status of this species is described in the species recovery plans (USFWS, 1990; USFWS, 2009). Several forest types, including scrub forest, are used for foraging, roosting, and breeding. While there is no longer a colony roosting on Guam, according to DAWR, the island still supports between 50 and 100 individuals (Wiese 2018).

Mariana fruit bats are strong, highly mobile fliers that have been observed traveling long distances, even between islands in the Marianas (USFWS, 2009). Most bat sightings in Ritidian are strays from colonies in nearby Rota (Wiese, 2018). The fruit bats in southern Guam are solitary individuals that forage in the ravine areas between Leo Palace Resort and Windward Hills, and are known to use the forests in Chalan Pago as a corridor to foraging grounds (Pers. communication, Jeff Quitugua, DAWR). Mariana fruit bats became more common and widespread on Guam since Typhoons Mangkhut and Yutu in September and October 2018, respectively, and these solitary bats may have come to the island to forage after the storms (Personal communication, Toni Mizerek, USFWS, April 19, 2019).

Bats primarily roost during the day and typically have high fidelity to certain roosting sites (e^2M, 2008). These mammals are largely frugivorous and leave their roost for several hours after sunset to forage (USFWS, 1990), although solitary bats may be more mobile in the early morning hours (Wheeler and Aguon, 1978). Illegal hunting, loss of forest habitat, and brown tree snake predation are the primary threats to Mariana fruit bats (USFWS, 2009; Wiles and Brooke, 2009). The bats may also be stressed by noise and light pollution, which can cause the animals to flush and alter their behavior (Personal communication, Toni Mizerek, USFWS, April 19, 2019). Human activity, even detection of human scent, has resulted in the abandonment of colony roost sites in Andersen Air Force Base in northern Guam; this sensitivity by fruit bats to human activity is considered to be a response to former heavy hunting pressure at colony roost sites (e^2M, 2008).

Migratory Birds. The Migratory Bird Treaty Act of 1918 (16 USC 703-711) protects migratory birds and their nests and eggs. Over 40 species of non-resident migratory shorebirds are known to winter in Guam (DAWR, 2019). The main southward migration of shorebirds to the region typically begins in August and continues through October (Williams and Williams 1988). Most shorebirds leave by the following April and May (Personal communication, Jeff Quitugua, DAWR). The Pacific golden plover (*Pluvialis fulva*), a non-resident avian species protected under the MBTA (50 CFR Part 10.13), was observed during the March 2022 surveys with the fenced, developed, open fields south of the FBLG and SSHS campuses.

Resident avian species (such as the white tern or yellow bittern) listed as protected under the Migratory Bird Treaty Act (MBTA) (50 CFR Part 10.13) were observed during surveys of the action area. Yellow bitterns or kakkak (*Ixobrychus sinensis*) are most commonly found in savanna grasslands and freshwater wetlands but may forage in screwpine (*Pandanus* spp.) or coconut (*Cocos nucifera*) trees (Jenkins, 1983). This species is carnivorous, with a diet ranging from tiny insects to snails, fish, and reptiles (e.g., skinks and geckoes) (Jenkins, 1983). The birds prefer to nest near marshes and freshwater wetlands but are occasionally known to nest in upland habitats, such as dry fields and grassy thickets (Jenkins, 1983). Peak nesting appears to occur during dry season months (January through June). No nesting has been reported on Guam in May, July, August, and September, presumably because heavy rains may flood the nests

(Jenkins, 1983). Data from other Pacific Islands indicates egg incubation ranges from 17 to 20 days, and the young will leave their nest around 20 days later (Birds of the World, 2020a).

Unlike many of the seabirds known from Guam protected under the MBTA, white terns or Chunge' (*Gygis alba*) breed on Guam. A white tern will lay a single egg directly on an existing shallow surface, such as a tree branch, instead of building a nest; sometimes, urban structures are used (Birds of the World, 2020b). On Guam, white terns seem to favor nesting in ironwood (*Casuarina equisetifolia*) trees. Based on data from other islands in the Pacific, white terns incubate their egg for around 36 days, and upon hatching, the chick will depart the nest between 31 and 67 days later (Birds of the World, 2020b). Egg-laying appears to occur year-round on many Pacific Islands, although peak nesting periods vary among the regions (Birds of the World, 2020b).

Critical Habitat. Based on December 2, 2020, correspondence with USFWS, the action area is not located within a wildlife preserve, National Wildlife Refuge, or proposed or designated critical habitat under USFWS jurisdiction. The USFWS designated the Ritidian Unit of the Guam National Wildlife Refuge as critical habitat for the Mariana fruit bat, the Guam Micronesian kingfisher, and the Mariana crow in October 2004. The Ritidian Unit is located approximately seven (7) miles north of the Yigo project site, and encompasses approximately 1,217 acres, i.e., 385 terrestrial acres and 832 acres of submerged land offshore.

4.2 Current Survey and Methodology

Three DCA biologists were assigned to conduct the biological surveys on Lot 7022-2-R3 and Lot 7022-1 with each survey being performed by a pair of biologists at a time. On October 29, 2020, two of these biologists surveyed the SSHS campus site and portions of the forested southern sector. The team also surveyed portions of the adjacent Lot 7022-2-3 on the mornings of March 9 and 11, 2021 (Appendix A). In March 2022 additional surveys of the forested southern sector of the action area were performed. This was to include an additional portion of land (approx. 10 acres) south of the FBLG school campus in Lot 7022-1. During most survey days, the weather was clear and cool. However, on March 22, 2022 there was a slight drizzle for about 10 minutes while on March 24, 2022, it continuously rained for about an hour. The types of vegetation that make up this 34-acre project area are classified as 1.28 acres (5,176.98 sq. meters) bare land, 6.44 acres (26,061.76 sq. meters) impervious, 0.18 acres (732 sq. meters) scrub/shrub, 11.95 acres (48,368 sq. meters) scrub forest, and 14.1 acres (57,060.68 sq. meters) developed, open space (Appendix A, Figure 4). The 0.18 acres of scrub/shrub and the 11.95 acres of scrub forest were extensively investigated using meandering pedestrian surveys following the perimeter of the scrub forest, and creating transects within the scrub forest to document existing vegetation. The area adjacent and south of Lot 7022-2-R3 was also surveyed by the biologists; this sector comprised approximately 0.665 acres of scrub forest and 0.685 acres of developed, open space)

(Appendix A). The pedestrian surveys were performed by a team of three DCA biologists equipped with 7 x 50, 10 x 42, and 12 x 25 power binoculars.

The survey for listed orchids focused on potential orchid host plants. Orchid host plants encompass a wide range of native and non-native species, including molave (*Vitex parviflora*), fig (*Ficus* spp., nunu) and limeberry (*Triphasia trifolia*, lemonchina) (Personal communication, Catherine Brunson, USFWS, 19 January 2018). *T. guamense* has been observed on more than 19 different species (native and non-native) as well as on dead branches and trees (USFWS, 2017); however, this species is most commonly found on molave (*Vitex parviflora*) and screwpine (*P. tectorius*) (Joint Region Marianas (JRM), 2016; Department of the Navy (DON), 2017). Wild onion (*B. guamense*) has been observed in native and non-native host tree species including: hernandia (*Hernandia labyrinthica*), blue marble tree (*Elaeocarpus joga,* yoga), headache tree (*Premna serratifolia,* ahgao), looking-glass tree (*Heritiera longipetiolata,* ufa-halomtåno), bird catcher tree (*Pisonia umbellifera,* umumu), avocado *(Persea americana*), molave (*Vitex parviflora*), betel nut palm (*Areca catechu*, pugua), *Eugenia* spp., *Ficus* spp., *Dypsis* spp. or screwpine (*P. tectorius*), as well as in dead trees (Zarones et al. 2015; JRM, 2016; DON, 2017). In northern Guam, *Dendrobium guamense* has been found mostly on fig (*Ficus* spp.); in southern Guam (Naval Magazine) it has been found on numerous tree species (JRM, 2016). DCA biologists conducted searches of host plant branches and trunks for 5-10 minutes, depending on the size of the host plant and canopy, using binoculars as needed to view the overstory.

The search for mollusks focused on the presence of indigenous tree snails (Partulidae) listed as endangered by the USFWS in 2015. The biologists searched potential tree snail habitat where snail host plants were present, including coconut (*Cocos nucifera*) and seeded breadfruit (*Artocarpus mariannensis*) trees. Most of these trees were laden with epiphytic ferns, such as lanceleaf tongue ferns (*Pyrrosia lanceolata*). The searches were conducted over a period of about 10-20 minutes per tree or stand of plants by experienced biologists familiar with the listed tree snails. The ventral and dorsal surfaces of the host plants were searched either manually or with binoculars. The survey methods included searching the ground within the site for any bleached or recent shell remains.

The presence of the indigenous, locally and federally-protected Guam tree snails (*Partula radiolata*) was observed in the central portion of the southern scrub forest within the project site. Upon discovery of the Guam tree snail, the approximate extent of the colony was determined by surveying outwards in all directions until the presence of Guam tree snails was no longer detected. Trees and shrubs that were occupied by Guam tree snails were conspicuously marked with bright yellow colored flagging tape labeled “ENDANGERED SNAILS – KEEP OUT”. A conservative colony size of 274 species was observed throughout this sector of the action area. However, as a comprehensive survey was not conducted and only the extents of the colony were established, it is suspected that far more live snails may be present within the heart of the colony.

On the morning of Tuesday, March 22, 2022, two DCA biologists proceeded to the southern scrub forest for a biological survey. At which point, they noticed mass clearing of vegetation within the northeastern sector of the scrub forest. Biological surveys were conducted on Monday, March 21, 2022, the morning prior to this discovery, until about 12:45 pm. During the biological survey, all construction appeared and was assumed to be within the open field south of the SSHS campus (Appendix B, Photo 27). However, after the biologists had left for the day, the geotechnical contractor appeared to have initiated the clearing of vegetation for soil investigations at multiple boring sites within the southern scrub forest. As a result of this decision, the 75-foot (23-meter) buffer zone recommended for snail protection was not met. Upon discovering the vegetation clearing, the biologists began pedestrian surveys at the boring site (B-23) thought to be closest to the snail habitat. Vegetation for this boring appeared to stop at the border of the Guam tree snail (*P. radiolata*) colony, exposing any snails occupying trees or shrubs along the border (Appendix B, Photo 28). Although the snails seemed to be exposed, no recently empty, unbleached snail shells were found on the ground. Occupied trees or shrubs were flagged with bright yellow tape, and the geotechnical contractor and TRMA were immediately notified. The remainder of the vegetation clearing and construction within the southern scrub forest was halted to allow for the extent of the Guam tree snail (*P. radiolata*) colony to be determined by DCA. Upon completing the B-23 investigation, two biologists surveyed the other boring sites. Guam tree snails (*P. radiolata*) were not observed immediately within the vicinity of the other clearings for soil boring sites. Areas not yet cleared but marked for soil investigations were also surveyed for snails. Any occupied Guam tree snail (*P. radiolata*) habitat was flagged with bright yellow flagging tape.

4.3 Terrestrial Flora

The U.S. Forest Service (2014) analyzed satellite imagery and performed surveys to produce a vegetation map of Guam using a classification scheme based on land cover. Based on this scheme, the following classes were mapped within the Simon Sanchez High School action area: Impervious, Developed, Open Space, Bare Land, Scrub Forest, and Scrub/Shrub (Appendix A, Figure 4). Pedestrian surveys were conducted to characterize the existing plant communities and identify any species of concern that may require special consideration. All plants recorded during the survey are listed in Appendix C.

Impervious, Developed, Open Space and Bare Land. The north sector of the action area encompasses the existing SSHS facility, including a basketball court, a soccer field, a gym, parking space, and the school itself. A chain-link fence extends along the entire southern boundary of the campus grounds, but does not delineate the property boundary (see Appendix E). This fence generally separates the Developed, Open Space of the SSHS and FBLG campus to the north from the Scrub Forest area to the south. A stand of ironwood (*Casuarina equisetiflia)* trees and wild cane (*Saccharum spontaneum)* grasses occupy the area north of the fence; however, the majority of the non-paved area is an open field. Immediately south of the fenced perimeter, a dirt

road runs parallel to the fence and continues west beyond the project area. The area south of the fenced perimeter but north of the scrub forest contains pioneering vegetation, including flowering stands of yellow alder (*Turnera ulmifolia*) with scattered patches of low-stature rustweed (*Polypremum procumbens*), turkey tanglefoot (*Phyla nodiflora*), and St. John's sedge (*Fimbristylis cymosa*), and an occasional *Buchnera floridana* (Appendix B, Photos 3 and 4).

Scrub Forest and Scrub/Shrub. Fosberg (1960) describes scrub forest as a secondary vegetation type that may have once been limestone forest but has since had a long history of human disturbance leading to its present condition. Scrub forest is mapped as the main vegetation type within Lot Nos. 7022-2-R3 and 7022-1. According to the most recent forest assessment, scrub forest comprises the largest vegetation class on Guam, covering 29,745 acres (U.S. Forest Service 2014).

At the SSHS project site, the most prevalent species in the overstory were tangantangan (*Leucaena leucocephala*), coconut (*Cocos nucifera*), pago or beach hibiscus (*Talipariti tiliaceum*), and molave (*Vitex parviflora*) trees laden with golden pothos vines (*Epipremnum aureum)*. The majority of the overstory trees throughout the property are covered with epiphytic ferns such as lanceleaf tongue ferns (*Pyrrosia lanceolata)* and *Microsorum punctatum* as well as epiphytic vines such as golden pothos (*E. aureum*), creeping philodendron (*Rhaphidophora decursiva*), and arrowhead vine (*Syngonium angustatum*). Trees that had epiphytes were extensively searched for listed endangered snails and threatened orchids. Binoculars were used to inspect the overstory for federally-listed threatened orchids on potential host trees. These included seeded breadfruit (*A. mariannensis*) and screwpine (*P. tectorius)*. Other native flora, such as the sumac (*Aidia cochinchinensis*) and luluhut (*Gymnosporia thompsonii,* syn. *Maytenus thompsonii*), were observed and are listed in Appendix C.

The southeastern sector of the parcel contains tall coconut (*C. nucifera*) and tangantangan (*L. leucocephala*) trees. This area is accessed by walking through a dirt road and tramping through wild cane grass (*Saccharum spontaneum*), beggar's tick (*Bidens alba*), elephant grass (*Pennisetum purpureum)*, swordferns (*Nephrolepis biserrata)*, and one large molave (*V. parviflora)* tree laden with golden pothos (*E. aureum*) vines interspersed amongst the other vegetation. On the southern boundary of the action area is a row of coconut (*C. nucifera*) trees of varying heights, which may have been planted by the adjacent bordering residences. Around the border of this southwestern sector are pago (*T. tiliaceum*) trees and tangantangan (*L. leucocephala*) trees.

The perimeter of the southeastern sector has one large, seeded breadfruit (*A. mariannensis)* tree along the dirt access road, as well as screwpine (*Pandanus tectorius)* and flametree (*Delonix regia*), none of which had ESA-listed epiphytes growing on them. Pago (*T. tiliaceum*) trees within this sector were laden with bird's nest fern (*Asplenium nidus*) or densely packed creeping

philodendron (*Rhaphidophora decursiva*) vines (Appendix B, Photo 9). Additionally, there were lemonchina (*Triphasia trifolia)*, indigo berry (*Passiflora suberosa)*, drumstick (*Moringa oleifera*) tree, and latherleaf or gaso'so (*Colubrina asiatica*) (Appendix B, Photo 22). In the understory were bilimbi or pickle tree (*Averrhoa bilimbi)* saplings, soursop (*Annona muricata*) saplings, and a lada (*Morinda citrifolia*) sapling with false rattan (*Flagellaria indica)* growing adjacent to it. Near the southeastern border was a former shipping container among a cluster of Moses-in-a-cradle (*Tradescantia spathacea*) plants (Appendix B, Photo 10). About 15 feet to the north was a pile of garbage, which was previously observed during the October 2020 survey, along with a betelnut (*Areca catechu*) tree.

The central-southeastern sector contained an understory of swordferns (*N. biserrata*) up to five feet tall. Woody species included introduced fruiting trees such as, pickle tree (*A. bilimbi*) and soursop (*A. muricata*), and native species such as pago (*T. tiliaceum*), abas duendes (*Glochidion marianum*), and lada (*Morinda citrifolia*), which occurred beneath an overstory of molave (*V. parviflora)* and pink tecoma (*Tabebuia heterophylla*) trees. Among these trees, the native ifit (*Intsia bijuga*) tree was found along the southern sector of the forested sector abutting Lot 7022-2-2R/W. The uncommon vine *Morinda umbellata* (vining morinda) was seen sprawling over the molave (*V. parviflora)*. Several molave (*V. parviflora*) trees were windthrown, especially in the southern sector (Appendix B, Photo 11). Additionally, although not ESA-listed, flowering moth orchids (*Phalaenopsis amabilis*) can be found close to the southern border of the southeastern sector of the forested area (Appendix B, Photo 16). A ground orchid (*Zeuxine fritzii*) and the native worm orchid or kamuke-nanofe (*Taeniophyllum mariannense*) can also be seen within this same area, but along the northern end of the forested sector (Appendix B, Photos 12 and 13).

The central-southwestern sector's understory was comprised of swordferns (*N. biserrata*), lada (*Morinda citrifolia*), screwpine (*Pandanus tectorius*), knob-fruited screwpine or Påhong (*Pandanus dubius*), and fagot (*Ochrosia oppositifolia)*. Common epiphytes were lanceleaf tongue ferns (*Pyrrosia lanceolata*) and *Microsorum punctatum*. False rattan (*Flagellaria indica*), a semi-woody climbing plant, permeates this sector, climbing to the top of trees such as the seeded breadfruit (*A.* mariannensis) and blue marble tree (*E. joga*). These trees, along with pago (*T. tiliaceum*), fagot (*Ochrosia oppositifolia*), and molave (*V. parviflora*), were observed in the overstory of this sector. Another uncommon plant sighted within this portion of the project area was zebrawood or panao (*Guettarda speciosa*).

The southwestern section of the project area contained swordferns (*N. biserrata*), false giant taro (*Alocasia macrorrhizos*), screwpine (*P. tectorius*), young, seeded breadfruit (*A. mariannensis*), starburst clerodendrum (Cl*erodendrum quadriloculare*), betelnut (*A. catechu*), and lada (*M. citrifolia*) all within the understory. Furthermore, the overstory consisted of pago (*T. tiliaceum*), screwpine (*P. tectorius*), and tangantangan (*L. leucocephala*). Among these trees, epiphytic ferns such as the lineleaf (*Antrophyum plantagineum*), lanceleaf tongue fern (*P. lanceolata*), and *M. punctatum* were observed. Other epiphytic vegetation within this portion of the project site

were aggressive and invasive vines such as golden pothos (*E. aureum*), *Derris trifoliata*, tonkin creeper (*Telosma cordata*), and wild bitter melon (*Momordica charantia*). False rattan (*F. indica*), a prevalent climbing plant, was found interwoven among the overstory trees with vines reaching down to the ground floor throughout the project area. The entirety of the southwestern sector was laden with trash (metallic and household waste) (Appendix B, Photo 24).

4.4 Terrestrial and Avian Fauna

All fauna observed during the March 9 and 11, 2021 as well as the March 2022 surveys are documented in Table 1.

Table 1. Terrestrial and Avian Fauna Observed in March 2021 and March 2022 within or adjacent to the Simon Sanchez High School Project Site, Lot Nos. 7022-2-R3 and 7022-1, Yigo, Guam

	Common Name	**Status**	**Abundance**
MOLLUSKS			
Drymaeus multilineatus	Lined tree snail	I	R
Partula radiolata	Guam tree snail	E	C
Satsuma succincta	Cinnamon bun snail	I	C
REPTILES			
Carlia ailanpalai	Four-toed skink	I	R to U
Emoia caeruleocauda	Pacific bluetail skink	N	R
Varanus tsukamotoi	Monitor lizard	N	R
BIRDS			
Dicrurus macrocercus	Black drongo	I	R to U
Gallus gallus domesticus	chicken	I	R
Gygis alba	white tern	N/M	R to U
Ixobrychus sinensis	yellow bittern	N/M	R
Passer montanus	Eurasian tree sparrow	I	R
Pluvialis fulva	Pacific golden plover	M/V	R to C
Streptopelia dusumieri	Philippine collared-dove	I	R
MAMMALS			
Canis lupus familiaris	Stray dog	I	R
Sus scrofa	Feral pig	I	R*
Key to Status (Guam Department of Agriculture, 1998): I=introduced resident; N= native; E=endemic; M= migratory; V= visitor. Abundance Ratings: Birds (sightings/vocalizations per 8-minute period or incidental: R = rare (1 to 2); U= uncommon (3 to 6 per observation); C= common (7 to 10); A= abundant (more than 10). Other fauna (sightings or signs per 1-hr period): R= rare (1 to 4); U= uncommon (5 to 9); C= common (10 to 19); A= abundant (20 or more); * = not directly observed, only signs detected (scat, rooting, rubbings, etc.)			

4.4.1 Mollusks

The native Guam tree snail (*Partula radiolata*) as well as the introduced cinnamon bun snail (*Satsuma succincta*) and lined tree snail (*Drymaeus multilineatus*) were the only live snails observed during the pedestrian field surveys. The Guam tree snail and cinnamon bun snail were frequently observed on lada (*M. citrifolia*) and latherleaf (*C. asiatica*) throughout the forested southern section of the action area, while the lined tree snail was only observed on creeping philodendron (*R. decursiva*) and arrowhead vine (*Syngonium angustatum*) to the southeast and on betelnut (*A. catechu*) to the southwest of the project site.

The presence of the indigenous, locally and federally-protected Guam tree snail (*P. radiolata*) was first detected within the central portion of the southern scrub forest on March 18, 2022. Many *P. radiolata*, of all life stages were observed on low-lying vegetation within the central portion of the southern forested area. Their prevalence within the understory allowed for an accurate identification of the species. Table 2 presents the vegetation occupied by the Guam tree snail (*P. radiolata*) during the March 2022 surveys and the number of individual snails sighted on each plant species. Lada (*Morinda citrifolia*), fagot (*Ochrosia oppositifolia*), and latherleaf (*Colubrina asiatica*) were the most common plants within the action area to host Guam tree snails. A conservative colony size of 274 species was observed throughout the action area. However, given that a comprehensive survey was not conducted and only the extent of the colony was established, it is suspected that far more live snails may be present within the heart of the colony.

Bleached shells of the cinnamon bun snail (*S. succincta*), the giant African snail (*Lassachatina fulica*), and the common Pythia (*Pythia scarabaeus*) were observed throughout the forested southern section of the action area. Bleached cinnamon bun snail (*S. succincta*) shells were also observed around the large, seeded breadfruit (*A. mariannensis)* tree at the southeastern section of the action area.

Table 2. Vegetation occupied by the Guam Tree Snail (*P. radiolata*) in March 2022 within the Simon Sanchez High School Project Site, Lot Nos. 702202-R3 and 7022-1, Yigo, Guam

Vegetation Type	Common Name/ Chamorro Name	Number of Snails
Trees, Shrubs, Herbs		
Artocarpus altilis	Seedless breadfruit/Lemmai	9
Cocos nucifera	Coconut Tree/ Niyok	5
Colubrina asiatica **2**	Latherleaf/ Gaso'so	45
Flagellaria indica	False Rattan/ Beyuko halomtano'	18
Ficus tinctoria	Fig/ Hoda	1
Geniostoma rupestre var. glaberrimum	N/A	4
Glochidion marianum	Åbas duendes	3

Vegetation Type	Common Name/ Chamorro Name	Number of Snails
Gymnosporia thompsonii	Luluhut	2
Intsia bijuga	Ifit	1
Ixora chinensis	Chinese ixora	1
Morinda citrifolia **1**	Indian Mulberry, Noni /Lada	93
Ochrosia oppositifolia **3**	Fagot	33
Pandanus dubius	Knob-fruited screwpine/Påhong	1
Pandanus tectorius	Screwpine/ Kafu'	13
Premna serratifolia	Headache tree/ Ahgao	11
Swietenia mahagoni	Cuban Mahogany	2
Talipariti tiliaceum	Sea Hibiscus / Pago	23
Vitex parviflora	Molave/ Ahgao Manila	3
Ferns		
Microsorum punctatum	N/A	6
Total snails observed:		**274**
Key: "**1**" = Ranked snail sightings on plant species, 1 being the most sightings		

4.4.2 Reptiles

The only reptiles observed during the pedestrian surveys were the introduced four-toed skink (*Carlia ailanpalai*), the native Pacific bluetail skink (*Emoia caeruleocauda*), and the native monitor lizard or hilitai (*Varanus tsukamotoi*). The arboreal and nocturnal brown tree snake (*Boiga irregularis*) was not observed during the daytime pedestrian surveys. This introduced fruit bat and bird predator (Wiles and Brooke, 2009) is expected to forage in the action area, especially since domestic chickens (*Gallus gallus domesticus*) have been observed in the vicinity.

4.4.3 Birds

The native yellow bittern or kakkak (*Ixobrychus sinensis*) was observed during daytime pedestrian surveys; however, no nests by this resident migratory bird were detected. Philippine collared doves (*Streptopelia dusumieri*) were observed during early morning bird surveys conducted on March 9, 2021, and March 18, 2022. The bitterns were seen on the tangantangan (*L. leucocephala*) trees within the action area, while the collared doves were seen on separate occasions flying low and fast or foraging within the action area. During pedestrian surveys, biologists observed stray chickens (*Gallus gallus domesticus*) in the southern sector, presumably from the neighboring residences. On March 9, 2021 four white terns (*Gygis alba*) were seen flying over the open fields of the southern sector of the SSHS parcel, while on March 22, 2022, five white terns (*G. alba*) were spotted flying over the bare land sector south of the SSHS campus. It is possible that these birds may be using the ironwood (*C. equisetifolia*) trees that exist on the developed, open space north of the chain link fence to either roost or nest. During the

bird survey conducted on March 11, 2022, two Eurasian tree sparrows (*Passer montanus*) were observed heading from the campus towards the forested southern section of the action area. Additionally, Pacific golden plovers (*Pluvialis fulva*) and black drongos (*Dicrurus macrocercus*) were often observed dispersed throughout the open fields, within the fenced areas south of the SSHS and FBLG campuses. On any given biological survey day, no more than eight plovers (*P. fulva*) and three black drongos (*D. macrocercus*) were observed at one time.

4.4.4 Mammals

The Mariana fruit bat was not detected during the fruit bat surveys on March 9 and 11, 2021, by two DCA biologists. The action area and vicinity contain thirteen potential food plants and eight potential roost plants for the Mariana fruit bat (e^2M, 2008) (Appendix C). Of the potential food species, the only species that were fruiting during the biological survey periods was papaya (*Carica papaya*) and blue marble (*Elaeocarpus joga*) tree in March 2022. Heavy human activity was detected in the project area, with occupied residential and storage structures, such as shipping containers and non-functioning school buses, observed in the southern sector. Household waste and dumped animal carcasses were observed in March 2022 along the unpaved road parallel to the fenceline delineating the southern campus boundary in Lot Nos. 7022-2-R3 and 7022-1. Additional rubbish was observed along the western boundary of Lot 7022-1. Considering the regular presence and activity of humans in the project area, the likelihood of Mariana fruit bats to be present is considered low.

The large, seeded breadfruit tree (*Artocarpus mariannensis*) in the action area was not actively fruiting in March 2021 and 2022, and there were no fallen breadfruit in the area beneath the canopy. When the breadfruit is in its fruiting season, it might attract feral pigs (*Sus scrofa*). During the biological surveys conducted in March 2021 and 2022 no feral pigs were sighted. However, in March 2022, the presence of feral pigs was apparent through the observations of animal scat and damaged tree trunks (Appendix B, Photo 26). In addition to feral pigs, stray and potentially non-stray dogs (*Canis lupus familiaris*) have been observed frequenting the project area during the pedestrian surveys.

5 EFFECTS ANALYSIS

5.1 ESA-Listed Orchids

The current surveys of the Simon Sanchez High School (SSHS) action area did not find any ESA-listed plants, including the following orchids: *Bulbophyllum guamense, Dendrobium guamense* and *Tuberolabium guamense*. The area may be considered marginal habitat for these epiphytic orchids based on the dominance of pago (*T. tiliaceum*) in the scrub forest, and the extensive areal coverage of golden pothos vines on most potential host trees in the action area. Therefore, we have determined that the proposed action will have **no effect** on these listed plant species.

5.2 ESA-Listed Tree Snails

The March 2022 pedestrian surveys detected a colony of approximately 274 Guam tree snails (*Partula radiolata*) within the central portion of the southern forested sector of the action area. Although no observations occurred of the humped tree snail (*Partula gibba*) and fragile tree snail (*Samoana fragilis*), habitat for these species is present in the action area. All life stages of the Guam tree snail would be exposed to the following project elements. Minimization and avoidance measures for these project elements (Section 2.3) are discussed below and summarized in Table 3.

Vegetation removal. The removal of vegetation has the potential to result in a direct take of the listed species if the vegetation is occupied at the time of removal. The loss of buffer vegetation has the potential to disrupt the microclimate that supports ESA-listed tree snails, exposing them to dry conditions and potentially leading to desiccation and death. Biological monitoring of potential tree snail habitat would be performed in advance of vegetation removal to confirm no ESA-listed tree snails are present. Construction activities in the vicinity of the Guam tree snail colony site would avoid the removal of vegetation that may serve as habitat for snails. A permanent dust barrier and security fence would be installed for the duration of construction work to minimize desiccation effects. The dust barrier and fence would be maintained after construction so long as the habitat continues to be occupied by the snail colony.

Dust Generation. Construction activities would involve excavation and demolition activities to install and construct the new campus, which would generate dust. Vehicle traffic associated with these activities would also generate dust. The generation of dust in proximity to occupied snail habitat has the potential to smother live snails, potentially leading to desiccation and death. In accordance with conservation measures described earlier, dust barriers would be erected between occupied habitat and the construction activities for the duration of the work, and beyond construction while the habitat is occupied by tree snails. The barriers would be inspected prior to commencement of construction activities, and periodically checked to ensure they are functioning as intended. Dust suppression would be performed as needed to reduce dust levels in the construction zone and minimize the migration of fugitive dust. A dust barrier/security fence would be erected adjacent to occupied tree snail habitat and under the supervision of biologists to protect adjacent occupied snail habitat. The dust barrier/fence would remain in place while the habitat is occupied by listed tree snails.

Noise and vibration disturbance during construction. There is currently no known information on harmful effects to Guam tree snails (*P. radiolata*) through noise and vibration (Personal communications, Dr. Curt Fiedler and Barry Smith). Guam tree snails have no auditory organs; however, it is possible that tree snails could be harassed or annoyed through the generation of vibrations, and react to this by altering their behavior, however, this has yet to be documented. The Pacific Islands USFWS Office has provided environmental reviews of

renewable energy projects and listed their primary concerns associated with this type of development for Hawaii's threatened and endangered species, including tree snails (USFWS, 2014). Although Hawaii's tree snails are not in the same family as the Guam tree snail, it should be noted that "noise and vibration disturbance during construction" of onshore wind farms, for instance, was not listed as a concern for Oahu tree snails (*Achatinella* spp.), Newcomb's tree snails (*Newcombia cumingi*) or Lanai tree snails (*Partulina semicarinata*) (USFWS, 2014). Instead, only habitat impacts, such as direct impacts caused by vegetation clearing, or indirect impacts caused by spreading of invasive species and increased fire risk, were listed for these Hawaii tree snail species (USFWS, 2014). Ambient noise levels in the vicinity of the new SSHS action area are mostly attributed to the existing high school and middle school campuses, vehicle traffic and residential uses. The proposed construction activities are expected to temporarily increase the noise levels during daylight hours, particularly during removal of vegetation and construction of the new facilities.

Stormwater runoff. Unmanaged **s**tormwater runoff could have the potential to flood occupied tree snail habitat and flush tree snails away from their habitat. Although the Guam tree snail (*P. radiolata*) primarily inhabits trees within the SSHS action area, they were also found on understory species (e.g. bird's nest fern). Dr. Curt Fiedler of UOG has also stated that during rainfall events, he has observed tree snails moving on the ground (Personal communication, January 23, 2018).

These best management practices and conservation measures described above, in Section 2.4 and summarized in Table 3 would be implemented by GDOE and their construction contractor in order to avoid or minimize potential effects on the ESA-listed and endemic Guam tree snail, and native humped tree snail and fragile tree snail if present. Therefore, we have determined that the proposed action **may affect, but is not likely to adversely affect** these listed snail species.

5.3 Mariana Fruit Bat

The current Mariana fruit bat population is estimated to have between 50 and 100 individual bats remaining on Guam (Wiese, 2018). No fruit bats were detected during the March 2021 and 2022 morning surveys. If present, all life stages of this species would be affected by the following project elements: vegetation removal, dust and spill generation, noise, light and vibration, and human activity. To minimize any potential direct or indirect effects on this ESA-listed species during construction, GDOE and the Contractor would implement conservation measures and best management practices for the Mariana fruit bat described in Section 2.4 of this BA and summarized in Table 3.

The proposed action would disturb or remove vegetation within the SSHS action area such as the large breadfruit tree (*A. mariannensis*) and the surrounding scrub forest (Appendix A, Figures 4 and 5), which may serve as potential foraging habitat for fruit bats (Appendix A, Figures 4 and

5). However, biological monitoring would be performed in advance of this activity to confirm no fruit bats are present and using the area. The proposed construction of a new SSHS campus would remove approximately 0.18 acres of scrub/shrub and 9.45 acres of scrub forest. Considering the availability of similar forest habitat beyond the action area in other parts of Yigo and throughout the island (29,745 acres), the potential effect of lost foraging habitat (9.45 acres) is determined to be insignificant (USFS, 2014). Since no construction is proposed to take place at night and in the early morning hours when bats are most active, there is a low potential for encountering this species. Given the absence of bats detected in the recent survey, the availability of scrub forest as foraging habitat elsewhere on the island, and the implementation of conservation measures to minimize or avoid the potential for encountering this species, the effects of the proposed action on the Mariana fruit bat would be minimized. Therefore, we have determined that the proposed action **may affect but would not adversely affect** the Mariana fruit bat.

Table 3. Summary of Minimization and Avoidance Measures for ESA-Listed Species

Impact Type (Direct or Indirect)	Minimization and Avoidance Measures
Vegetation removal (direct and indirect impacts)	• Vegetation removal would be minimized to only the amount necessary to complete the work. The contractor will avoid cutting or removing vegetation within the established buffer zone surrounding the known tree snail occurrence to minimize impacts to the snails and their habitat. The Contractor shall not remove any existing vegetation within the buffer zone without the approval of DAWR, and if approved, this would be supervised by the GDOE biological monitor. Workers will remain alert and observant for damage to vegetation within the 23 m (75-foot) wide buffer surrounding the occupied tree snail area, or to the dust barrier. If vegetation is damaged, or the dust barrier is damaged or not functioning as intended, the worker will inform the DRP. The DRP will immediately suspend construction activities in the area until the situation is corrected. If vegetation is damaged, the DRP will inform the GDOE Construction Manager, who will contact USFWS/DAWR. The Contractor shall not remove any existing vegetation within 23 m (75 feet) of ESA-listed tree snail occupied areas without the approval of DAWR, including staging areas for equipment and materials. If approved, this vegetation removal would be supervised by the GDOE biological monitor. • Prior to the commencement of construction activities within a 23

Impact Type (Direct or Indirect)	Minimization and Avoidance Measures
	m (75-foot) distance of known occupied tree snail habitat, the Contractor would install a permanent security fence around the snail colony buffer prior to construction. The fence would be designed to deter unauthorized persons from accessing and disturbing the protected snail habitat. The fence would incorporate a permanent dust barrier. The permanent dust barrier and security fence would be installed and maintained for the duration of the work to minimize desiccation effects on tree snails. The dust barriers would remain in place and continue to be maintained by GDOE after construction as long as the Guam tree snail colony is occupied. • Following the installation of the dust barrier, the contractor would plant native trees and shrubs along the perimeter of the buffer to provide a more natural barrier for the colony. This enhancement vegetation would be planted between the dust barrier and scrub forest. • A qualified biologist or GDOE biological monitor would be present during installation of the dust barrier and security fence to prevent the accidental take of any tree snails. The DRP would regularly inspect the barriers and perform daily checks for listed species. • A qualified biologist or GDOE biological monitor will perform pre-construction surveys for listed tree snails and Mariana fruit bat when work occurs in the vicinity of potential habitat prior to the start of construction and vegetation clearing. One week prior to the commencement of vegetation removal or construction activities in the vicinity of all potential tree snail habitat, a qualified biologist or GDOE biological monitor would conduct a survey to reconfirm the colony boundary of ESA-listed tree snails (Partulidae). If a protected snail species is detected outside of the original established colony boundary, a Designated Responsible Person (DRP) will notify the GDOE Construction Manager, who will contact the USFWS and Guam Department of Agriculture for further technical assistance and guidance. • If a fruit bat is present within 150 m (492 feet) of the project site, the work in that area will be postponed until the bat has left the area voluntarily as confirmed and documented by a biologist. If no bats are detected, construction may commence. Once

Impact Type (Direct or Indirect)	Minimization and Avoidance Measures
	construction begins, if a fruit bat moves into the project footprint while work is ongoing, the work in that area will be immediately halted and postponed until the bat has voluntarily left the area.
Dust generation and spills (direct and indirect impact)	• Fill materials, pre-cast structures, and other project-related materials would be staged and stockpiled in upland areas either in the Government property or another upland location arranged by the contractor. No project-related materials would be stockpiled within or in close proximity to habitat occupied by listed species. • Dust suppression by watering down of road and installation of a dust barrier/security fence would be performed protect occupied tree snail habitat. The barriers shall be installed so that they will not damage adjacent tree snail habitat. • Containment booms and absorbent pads would be kept on-site during construction and readily available on-site for cleaning up lubricant or petroleum spills.
Noise, light and vibration disturbance (direct)	• Temporary noise during construction would be mitigated by BMPs and engineering controls. No construction would occur during evening or early morning hours. • If work must occur near Mariana fruit bat habitat, a GDOE biological monitor would check for the presence of these species prior to the start of work. If fruit bats are observed, no work would proceed until the animal has left voluntarily. If an onsite protected species does not depart the area on its own for three (3) days or more, the contractor will notify GDOE, who will contact the USFWS and Department of Agriculture for further technical assistance and guidance. • GDOE would use hooded lighting within 492 feet (150 m) of all potential fruit bat roost habitat. The lighting will be directed to shine away from potential fruit bat habitat. • Where feasible, the movement of heavy equipment and personnel would be confined to the existing roadways.
Stormwater (direct and indirect impact)	• Stormwater protection measures (e.g., sandbags or silt fences) would be installed strategically around the work area and maintained to contain sediments and direct runoff away from occupied habitat during construction. The DRP will be responsible for overseeing the regular maintenance, inspection and determination of BMP effectiveness during construction.

Impact Type (Direct or Indirect)	Minimization and Avoidance Measures
Human activity (direct and/or indirect)	• Trees and other plants occupied by ESA-listed tree snails are to be clearly marked and flagged only in their vicinity to avoid inadvertent dislodging and trampling of tree snails. The actual occupied plants will not be marked/flagged or damaged. • Signs labeled "DO NOT ENTER - Endangered Tree Snails Present" will be posted on the exterior of the permanent dust barrier/security fence surrounding the buffer vegetation at the Guam tree snail colony. The signs will be maintained by the Contractor for the duration of construction. • The Contractor's DRP will participate in awareness training for ESA-listed Tree Snails and Mariana fruit bat. The DRP will be responsible for training the supervisory staff, and for performing daily checks for listed species and overseeing the regular maintenance of protection measures at the start of the day, in the areas that will have construction activity that day. • GDOE and the Contractor would limit exposing fruit bat locations to the public and other contractors to reduce potential poaching of this species

5.4 Migratory Birds

The implementation of conservation measures (Section 2.4) would serve to reduce the proposed action's impacts on MBTA-listed species, and minimize the potential for incidental take. These measures include planning work outside of nesting periods to the extent practicable; hazing to discourage birds from nesting; and removing eggs or young if removal of occupied vegetation is not avoidable. Therefore, it is likely through these beneficial practices that construction activities as described would not violate the MBTA and would avoid incidental take of listed birds during the course of the new SSHS campus project.

6 CONCLUSION AND DETERMINATION OF EFFECTS

Based on the information presented in this BA, we have determined that the proposed action to construct a new high school in Lot Nos. 7022-2-R3 and 7022-1 will have no effect on the following ESA-listed species: wild onion *(Bulbophyllum guamense*), *Dendrobium guamense*, *Tuberolabium guamense*), humped tree snail (*Partula gibba*), fragile tree snail (*Samoana fragilis*).

With GDOE and the Contractor's implementation of the recommended Conservation Measures described in Section 2.4, we have determined that the proposed action **may affect but would not adversely affect** the locally and federally-listed and Mariana fruit bat (*Pteropus mariannus mariannus*) and Guam tree snail (*Partula radiolata*). Additionally, because of spatial separation, we have determined that the new SSHS campus project would have no effect on designated critical habitat for the Mariana fruit bat.

APPENDIX B

**Photographs of the Simon Sanchez High School Project Site,
Lot 7022-2-R3, Lot 7022-1, and Vicinity**

March 2021 and March 2022

Photo 1. View facing northwest along Juan Jacinto Street showing fenced eastern boundary of SSHS campus in Lot 7022-2-R3.

Photo 2. View facing west across Juan Jacinto Street showing fenced southeastern corner of SSHS campus. Behind the bus stop, a dirt road leads west from Juan Jacinto Street along the fence line. However, this fence line does not delineate the southern boundary of Lot 7022-2-R3.

Photo 3. View facing east along a dirt road abutting the fenced southern boundary of the SSHS campus in Lot 7022-2-R3. This fence line delineates the campus, but does not delineate the southern parcel boundary of Lot 7022-2-R3.

Photo 4. View facing southeast towards a narrow strip of scrub forest in the southern sector of Lot 7022-2-R3, south of the SSHS campus.

Photo 5. View facing west toward GWA Well Y-5 in Lot 7022-2-3, located south of a 40-foot wide access and utilities easement (Lot 7022-2-2R/W) and the SSHS campus property (Lot 7022-2-R3).

Photo 6. View facing south toward GWA Well Y-6 in Lot 7022-2-3, located south of Lot 7022-2-2R/W and the SSHS campus (Lot 7022-2-R3). The paved Juan Jacinto Street is to the left (east). A dirt-paved road leads west from Well Y-6 to Well Y-5.

Photo 7. View of the overstory within the eastern portion of the scrub forest running along the southern border of the parcel showing *Leucaena leucocephala* and *Taliparitiliaceum* trees.

Photo 8. View of the open canopy and fern understory within the central portion of the southern forested sector of Lot 7022-2-R3.

Photo 9. Dense stands of creeping philodendron (*Rhaphidophora decursiva*) within the east-southeastern sector of the southern forested potion of the forested area.

Photo 10. Cluster of Moses-in-a-Cradle by the storage container near the southeastern border.

Photo 11. One of many large windthrown trees throughout the southern scrub forest of the project site.

Photo 12. Uncommon orchid *Zeuxine fritzii* in the central-northeastern sector of the southern scrub forest.

Photo 13. View of the native worm orchid (*Taeniophyllum mariannense*) flowering in the project site.

Photo 14. View of golden pothos (*Epipremnum aureum*) vine, lineleaf fern (*Antrophyum plantagineum*), and *Microsorum punctatum* within the southwestern portion of the scrub forest.

Photo 15. Large boulders occupied the southwestern sector of the scrub forest.

Photo 16. View of one of two moth orchids (*Phalaenopsis amabilis*) present within the project area.

Photo 17. Uncommon vining morinda (*Morinda umbellata*) sprawling over other vegetation located in the central-southwestern sector of the scrub forest.

Photo 18. View of open earthen swale in the southwestern sector of the scrub forest in Lot 7022-1 leading to a bermed area dominated by pago or sea hibiscus (*Talipariti tiliaceum*) trees.

Photo 19. View of an earthen berms located in the southwestern sector of the scrub forest of Lot 7022-1. Since existing runoff flows towards this area, this sector is proposed for a stormwater basin.

Photo 20. Panoramic view within the southwestern potion of the scrub forest showing several golden pothos (*E. aureum*) "vine towers" that are potential tree snail habitat.

Photo 21. View within the central-southwestern potion of the scrub forest in Lot 7022-1 facing south. The orange arrow is pointing to a dilapidated shipping container and the red arrow is pointing to a broken-down school bus. These are likely utilized by squatters occupying a nearby structure.

Photo 22. View facing south at the southern border of Lot 7022-2-R3 showing drumstick tree (*Moringa oleifera*) and sprawling gaso'so (*Colubrina asiatica*) adjacent to a molave (*Vitex parviflora*) tree.

Photo 23. Photo of illegal trash dumping activities near the southeastern boundary of Lot 7022-2-R3.

Photo 24. Photo of illegal trash dumping activities near the southwestern boundary of Lot 7022-1.

Photo 25. Photo of animal scat observed on the bare land sector of the project site abutting the fenced southern boundary of the SSHS campus in Lot 7022-2-R3.

Photo 26. Photos of damaged tree trunks likely caused by feral pig (*Sus scrofa*) activity in the central southeastern portion of the project site. A pink cell phone is shown in the lower left of the photo for scale.

Photo 27. A drill rig was observed performing soil borings within the fenced open field south of the SSHS on the morning of Monday, March 21, 2022, at 10:27 am.

Photo 28. Photo of boring B-23 closest to snail colony on March 22,2022. The orange arrow in the center of the photo is pointing to the wooden stake placed to mark the ground of the boring location. A white arrow points to the yellow flagging of the closest vegetation occupied by the Guam tree snail (red circle).

Photo 29. An occupied lada (*M.* citrifolia) located along the northwestern extent of the colony conspicuously flagged with yellow flagging tape. A white arrow points to a Guam tree snail (red circle).

Photo 30. View facing scrub forest from the bare land to the north of the scrub forest. The red arrow in the center of the photo is pointing to the same flagged tree in Photo 29 occupied by the Guam tree snail.

Photo 31. Photos of the introduced four-toed skink (*Carlia ailanpalai*), which were uncommon within the southern scrub forest of the project site. The skink in the right photo is beginning to shed its skin.

Photo 32. A native Pacific bluetail skink (*Emoia caeruleocauda*) seen on screwpine of kafu' (*Pandanus tectorius*).

Photo 33. The lined tree snail (*Drymaeus multilineatus*) on creeping philodendron (*Rhaphidophora decursiva*) in the southeastern sector of the southern forested sector of the action area.

Photo 34. A cinnamon bun snail (*Satsuma succincta*) traversing along false rattan (*Flagellaria indica*).

Photo 35. Photos of Guam tree snails (*P. radiolata*) on latherleaf (*Colubrina asiatica*) in the project site. The left photo shows three snails (1 juvenile and 2 adults) occupying a single leaf. The right photo shows these same snails from afar occupying the same latherleaf plant within close proximity of other snails.

Photo 36. Photos of the Guam tree snail (*P. radiolata*) on March 21, 2022, actively roaming on latherleaf (left) and *Ochrosia oppositifolia* (right) plants after a period of rainfall the previous day in the project site.

Photo 37. DCA biologist collecting GPS coordinates (right photo) of adult Guam tree snail (*P. radiolata*) on lada (*M. citrifolia*) along the southern extent of the colony (left photo). GWA Production Well Y-05 can be seen in both photos.

Photo 38. Photo of five white terns (*Gygis alba*) flying over the southern scrub forest of the project site on the morning of March 22, 2022.

Photo 39. A black drongo (*Dicrurus macrocercus*) resting on an ironwood tree (*Casuarina equisetifolia*) within the fenced open field south of the FBLG campus.

Photo 40. A Pacific golden plover (*Pluvialis fulva*) within the fenced open field south of the SSHS campus.

APPENDIX C
Checklist of Vascular Plants Observed within or adjacent to the Simon Sanchez High School Project Site, Lot Nos. 7022-2-R3 and 7022-1 in Yigo, Guam

	Common Name	Chamorro Name	Status
Trees, Shrubs, Herbs			
Aidia cochinchinensis	N/A	Sumak	N
Allamanda cathartica	Golden trumpet	N/A	I
Alocasia macrorrhizos	False Giant Taro	Papao apaka	I
Annona muricata	Soursop	Laguanå	I
Areca catechu	Betelnut tree	Pugua	I
Artocarpus mariannensis **F, R**	Seeded breadfruit tree	Dokdok	**E
Artocarpus altilis **F, R**	Seedless breadfruit	Lemmai	I
Averrhoa bilimbi	Pickle tree	Bilimbi	I
Bidens alba	Beggar's tick	N/A	I
Buchnera floridana	N/A	N/A	I
Caesalpinia major	Yellow nicker-bean	N/A	N
Calophyllum inophyllum **F**	Mastwood, Palomaria	Da'ok	N
Carica papaya **F**	Papaya	N/A	I
Casuarina equisetifolia **F, R**	Ironwood tree	Gagu	N
Clerodendrum quadriloculare	Starburst Clerodendrum	N/A	I
Cocos nucifera **F, R**	Coconut tree	Niyok	N
Colubrina asiatica	Latherleaf	Gaso'so	N
Cordyline fruticosa	Ti plant	N/A	I
Delonix regia	Flametree	Atbut	I
Dracaena fragrans	Corn plant	N/A	I
Elaeocarpus joga **F, R**	Blue Marble Tree	Yoga	**E
Flagellaria indica	False Rattan	Beyuko halomtano'	N
Ficus tinctoria **F**	Fig	Hoda	N
Geniostoma rupestre var. glaberrimum	N/A	N/A	N
Glochidion marianum	N/A	Åbas duendes	**E
Guettarda speciosa **F, R**	Zebrawood	Panao	N
Gymnosporia thompsonii	N/A	Luluhut	**E
Hippobroma longiflora	Star-of-Bethlehem	N/A	I
Intsia bijuga	N/A	Ifit	N
Ixora chinensis	Chinese Ixora	N/A	I
Leucaena leucocephala	Hedge Acacia	Tangantangan	I
Morinda citrifolia	Indian Mulberry, Noni	Lada	N
Morinda umbellata	N/A	N/A	N

	Common Name	Chamorro Name	Status
Moringa oleifera	Drumstick Tree	Katdes	I
Ochrosia oppositifolia **F, R**	N/A	Fagot	N
Pandanus dubius	Knob-fruited screwpine	Påhong	N
Pandanus tectorius **F**	Screwpine	Kafu'	N
Peltophorum pterocarpum	Yellow Flame Tree	N/A	I
Persea americana **F**	Avocado	Alageta	N
Phalaenopsis amabilis	Moth Orchid	N/A	I
Phyla nodiflora	Turkey Tanglefoot	N/A	I
Planchonella obovata	North. Yellow Boxwood	Lalahag	N
Polypremum procumbens	Rustweed		I
Polyscias scutellaria	Platito, Saucer-leaf	N/A	I
Premna serratifolia **F, R**	Headache tree	Ahgao	N
Psychotria mariana	N/A	Aploghating	**E
Swietenia mahagoni	Cuban Mahogany	N/A	I
Tabebuia heterophylla	Pink Tecoma	N/A	I
Taliparitiliaceum	Sea Hibiscus	Pago	N
Taeniophyllum mariannense	Worm orchid	Kamuke-nanofe	***E
Tradescantia spathacea	Moses-in-a-Cradle	N/A	I
Triphasia trifolia	Limeberry	Lemonchina	I
Turnera ulmifolia	Yellow Alder	N/A	I
Vitex parviflora **R**	Molave	Ahgao Manila	I
Zeuxine fritzii	N/A	N/A	N
Ferns			
Antrophyum plantagineum	Lineleaf Fern	N/A	N
Asplenium nidus	Bird's Nest Fern	N/A	I
Microsorum punctatum	N/A	N/A	N
Nephrolepis biserrata	Swordfern	N/A	N
Phymatosorus scolopendria	Monarch Fern	N/A	I
Pyrrosia lanceolata	Lanceleaf Tongue Fern	N/A	I

Subject: Species List for Construction of New School Facility at Simon Sanchez High School Campus in Yigo, Guam

Dear Claudine Camacho:

The U.S. Fish and Wildlife Service (Service) received your correspondence on October 30, 2020 requesting a list of endangered, threatened, and candidate species and the presence of critical habitat in the vicinity of a proposed new school facility on the Simon Sanchez High School campus in Yigo, Guam.

Project Description
The new school facility will be located on a 29-acre parcel of land of which much has been previously cleared and developed for the existing high school facilities. A narrow strip of scrub forest remains along the length of the southern parcel boundary.

We reviewed the proposed project pursuant to the Endangered Species Act (ESA) of 1973, as amended (16 U.S.C. 1531 et seq.). Based on the information you provided and the pertinent information in our files, we determined that no designated critical habitat exists within or near the project site. The following species may occur within or pass through the project site.

Listed Species	Common/ Chamorro Name	Listing Status
MAMMALS		
Pteropus mariannus mariannus	Mariana fruit bat/ fanihi	Threatened
INVERTEBRATES		

Hypolimnas octocula marianensis	Mariana eight-spot butterfly/ abbabang	Endangered
Partula gibba	Humped tree snail/ akaleha	Endangered
Partula radiolata	Guam tree snail/ akaleha	Endangered
Samoana fragilis	Fragile tree snail/ akaleha dogas	Endangered
PLANTS		
Bulbophyllum guamense	Siboyas halumtano	Threatened
Cycas micronesica	Fadang	Threatened
Dendrobium guamense	No common name	Threatened
Nervilia jacksoniae	No common name	Threatened
Psychotria malaspinae	Aplokating palaoan	Endangered
Solanum guamense	Biringenas halumtanu	Endangered
Tabernaemontanta rotensis	No common name	Threatened
Tinospora homosepala	No common name	Endangered
Tuberolabium guamense	No common name	Threatened

Migratory birds
For questions regarding bird species federally protected under the Migratory Bird Species Act, please see the attached enclosure.

If it is determined that the proposed project may affect federally listed species, we recommend that you contact our office early in the planning process so that we may assist you with ESA compliance. We appreciate your efforts to conserve listed species and native ecosystems pursuant to the ESA. If you have additional questions, please contact Lauren Taylor at lauren_taylor@fws.gov or by telephone at (808) 792-9528. In future communications with us regarding this project, please refer to reference number: 01EPIF00-2021-SL-0043. To expedite the Service's response to any future official correspondence, please address it to pifwo_admin@fws.gov.

Sincerely,

JACQUELINE FLORES

Enclosures: Migratory Bird Species Act information.

Dear Project Proponent:

Thank you for your inquiry and for your interest in protecting migratory birds. There are several resources available to you in order to generate a Migratory Bird Species List for your project and to understand how to reduce impacts on migratory birds.

1) Migratory Bird Species List:
A list of the migratory bird species covered by the Migratory Bird Treaty Act, is available at this link.

2) IPaC:
The Information for Planning and Conservation (IPaC) tool is an online tool through which users may use to generate a list of Threatened and Endangered Species (https://ecos.fws.gov/ipac/). Information in IPaC is incomplete for migratory birds, particularly for birds on Pacific islands.

3) Site-Specific Bird Species Lists:
The best way to create a site-specific bird species list is for a biologist to visit the site and record bird occurrence throughout the year. If this is not possible, project proponents can generate a bird occurrence list in eBird which can inform your creation of a site-specific list of migratory birds.

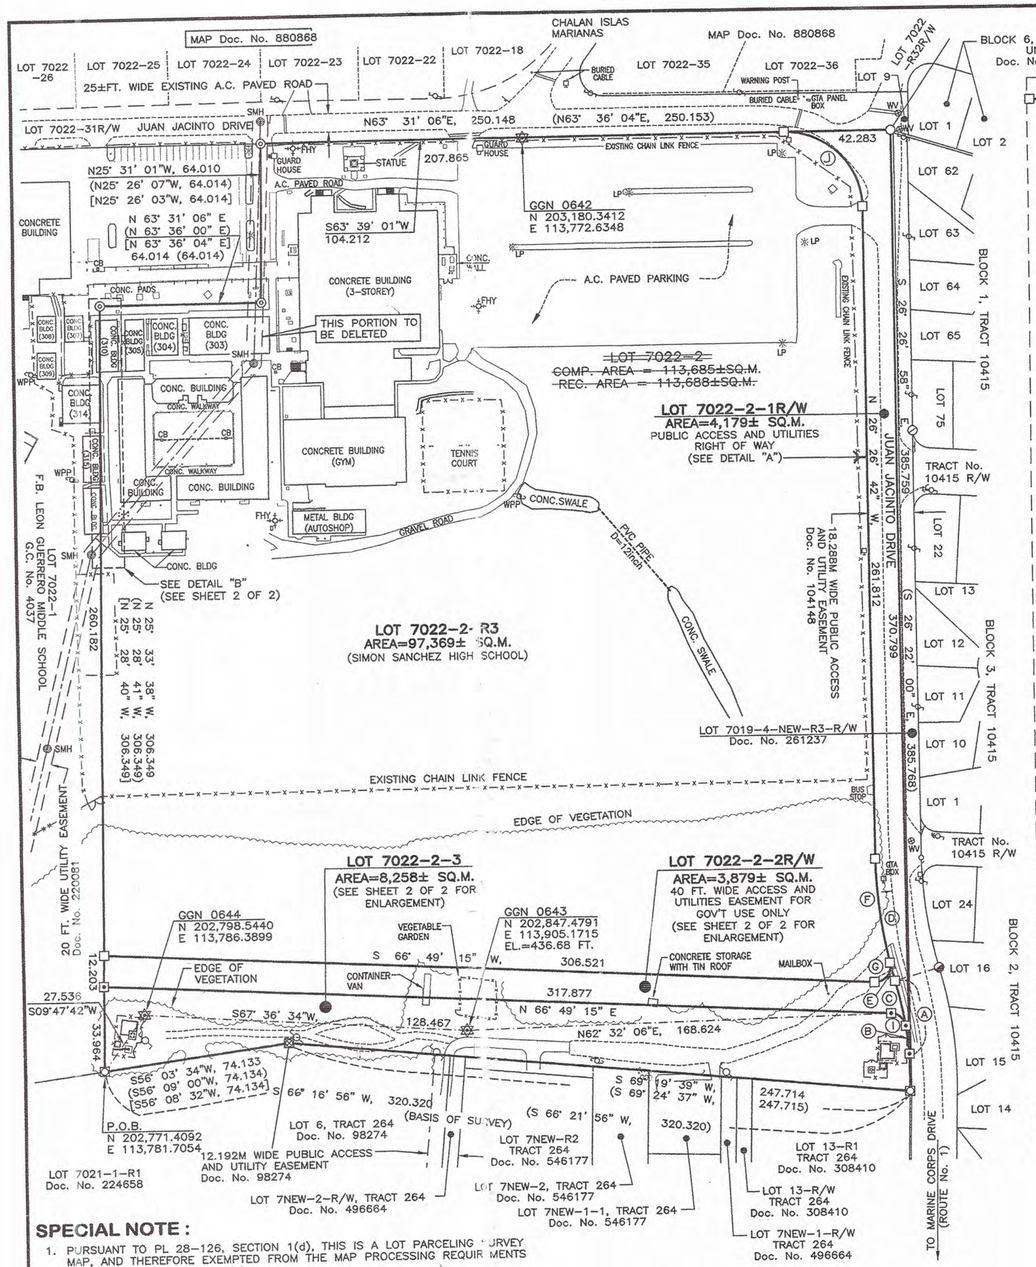
Once you arrive at the eBird website, click "Explore," and enter your state, county, province or country into the "Explore Regions" search bar. From there you can zoom into your specific project area, or select a hot spot that is closer to your project area.

3) Conservation Measures to Reduce Project Effects on Birds:

The M-Opinion developed by the Department of Justice solicitors in December 2017 states that incidental take is no longer a violation of the Migratory Bird Treaty Act. While take of nesting birds might occur during your project, if that take occurs incidentally to the purpose of your otherwise legal activity, then that take is not prohibited. If birds are purposefully killed, that is, the take is intentional, then it is prohibited unless you have a permit authorizing that take. It is likely that your construction activities as described would not violate MBTA if birds were harmed incidentally during the course of your development. Regardless, we encourage developers to minimize and avoid incidental take of migratory birds if possible.

Conservation measures geared toward specific activities may reduce your project's impacts on birds. Several fact sheets are available through the U.S. Fish and Wildlife Service (USFWS) Office of Migratory Birds Website.

Vegetation management is one of the most common construction-related activities that affects migratory birds. In particular, vegetation clearing associated with the construction may be timed to avoid peak nesting of birds; this is the easiest way to avoid incidentally killing or disturbing nesting birds. If timing of construction cannot be altered, consider removing any potential nesting trees, shrubs, or other bird nesting habitat in the footprint of the project at a time when the birds are not nesting, e.g., well in advance of construction. In order to plan the



vegetation removal or other habitat disturbance, take account of the amount of time that a species of bird needs to complete their nesting effort, from egg laying to fledging, and plan your activity far in advance. Additional guidelines for vegetation control are available through the USFWS Office of Migratory Birds.

If take cannot be avoided, e.g., birds are actively nesting in trees that are slated for removal and site clearing cannot wait until the young fledge, then consider contacting a permitted rehabilitation facility to take the orphaned eggs or young. It might also be possible to discourage birds from nesting in trees by hazing or bothering them in some way to the point that they abandon the site prior to settling in and laying an egg.

A similar approach can be taken for ground-nesting and burrow-nesting species, including seabirds. If a ground-disturbing activity must take place, plan it outside the nesting season.

Information on birds and their nesting seasons can be found by searching for species name at Wikipedia, and Cornell's All About Birds website.

ABSTRACT

At the request of Taniguchi Ruth Makio Architects +, Guam, International Archaeology, conducted archaeological survey and subsurface testing in support of the proposed expansion of Simon Sanchez High School, Yigo, Guam. The work described herein was required per Certificate of Approval No. 0504 from the Guam Historic Resources Division (GHRD). The work complies with Guam Executive Orders 89-9 and 89-24; Public Laws Title 21, GCA, Chapter 76; and the Department of Parks and Recreation, General Guidelines for Archaeological Burials, Section IV, Reburial Guidelines, as amended March 2010. The GHRD Review and Compliance (RC) number for this project is RC 2016-0961.

No archaeological deposits and no cultural resources were encountered during survey and subsurface testing. Results of the pedestrian survey and subsurface testing involving 46 shovel test pits revealed extensive post-World War II-era landscape modification and construction fill as evidenced by shallow, mixed, and/or fill deposits. These primarily date to the original construction of the school property as observed in the open grassy fields in the northeastern portion of the project area, and the generally shallow deposits and extensive debris/refuse push piles in the south/southwest portions of the area.

It is unlikely that subsurface archaeological deposits are still present in the project area. Additional archaeological testing and monitoring, therefore, is not recommended for the proposed project area or its immediate vicinity.

I. INTRODUCTION

At the request of Taniguchi Ruth Makio Architects +, Guam, International Archaeology, LLC (IA) conducted archaeological survey and subsurface testing in support of the proposed expansion of Simon Sanchez High School, Yigo, Guam (Figure 1 to Figure 3). This work was required per Certificate of Approval No. 0504 from the Guam Historic Resources Division (GHRD). All work complied with Guam Executive Orders 89-9 and 89-24; Public Laws Title 21, GCA, Chapter 76; and the Department of Parks and Recreation, General Guidelines for Archaeological Burials, Section IV, Reburial Guidelines, as amended March 2010. The GHRD Review and Compliance (RC) number for this project is RC 2016-0961.

The proposed Simon Sanchez High School expansion project encompasses constructing several new buildings, renovating several existing buildings, and upgrading the associated parking lots and utilities. Archaeological pedestrian survey and subsurface testing covered an area of approximately 27.75 ac., including the undeveloped portions of the Simon Sanchez High school property, as well as part of the adjoining F.B. Leon Guerrero Middle School property.

J. Stephen Athens, Ph.D., was the Project Manager (PM) and Principal Investigator (PI) for the project. As PM, Dr. Athens was responsible for overall management, ensuring that appropriate research standards were maintained, ensuring appropriate personnel were selected to conduct the project, and providing research direction and oversight to ensure the client's needs were fully addressed. As PI, he provided overall project-specific guidance for the project, including assistance in the establishment of research goals and procedures as appropriate to the project scope of work, and oversight of project development, field investigations, and report

preparation. Scott M. Fitzpatrick, Ph.D. and Michael C. Mlyniec, M.Sc. were the Project Co-Directors (PD). Dr. Fitzpatrick and Mr. Mlyniec were responsible for conducting field investigations, and Dr. Fitzpatrick wrote the technical report. Barbara VanBenthuysen, B.A., Darrel Hardy, B.A., Zeth Lujan, B.A., and Emily van Zanten, B.A., served as field technicians for the project. Fieldwork was conducted over the course of seven days from February 22–25, 2022, and March 7–8, 2023. Dr. Athens, Dr. Fitzpatrick, and Mr. Mlyniec meet the institutional and professional qualifications in *The U.S. Secretary of the Interior's Standards and Guidelines on Archeology and Historic Preservation* (48 FR [Federal Register], 44716 ff, 29 September 1983).

This document is organized into five sections. Section I introduces the project. Section II summarizes the physical environmental characteristics and important cultural and historical background information for the project area. Section III discusses the research questions and expectations that guided the project and the field methods that were employed. Section IV presents the results of the fieldwork. Section V discusses the results in the context of the research questions, and also provides a conclusion and management recommendations. All references cited in the report are presented after Section V. Appendix A is the Guam Historic Resources Division Archaeological Report Summary Form.

II. BACKGROUND

This section presents relevant background information to contextualize the current project. This includes summaries of the physical environment of Guam and the project area, the cultural and historical context of Guam, land use history of the project area, and previous archaeological research in the vicinity of the project area.

PHYSICAL ENVIRONMENT

The project area is on the island of Guam, the southernmost of the Mariana Islands in Micronesia (see Figure 1). The Mariana archipelago is about 2,300 kilometers (km) southeast of Japan, 6,100 km west of Hawai'i, and 2,600 km east of the Philippines. Guam, at the southern end of the approximately 644 km long archipelago, is the largest island in both the archipelago and Micronesia as a whole. With a land area of 539 sq. km, Guam is roughly 50 km long and 6.4 to 12.9 km wide on a roughly northeast axis. It is near latitude 13°2' N and longitude 144°4' E. Guam's nearest neighbor island in the Mariana chain is Rota, which is 71 km to the north-northeast.

CLIMATE

The Mariana Islands are characterized by a tropical rainforest climate with a monsoonal weather pattern—a dry season from January through June and a wet season from July through December. Average annual rainfall is 258.67 centimeters (cm) with a standard deviation of 56.39 cm. The dry season receives an average of 79.20 cm and the wet season 178.33 cm. A south-to-north decreasing rainfall gradient in the Mariana Islands exacerbates dry conditions during the dry season in the northern islands. The winter dry season is associated with the easterly

trade winds, whereas calm and light winds prevail during the summer rainy season. Additionally, every three to four years, El Niño/Southern Oscillation (ENSO) events are likely (Lander 1994), potentially causing especially dry conditions during the dry season. From time to time, west to northwest moving storm systems and typhoons bring unstable weather to the Mariana Islands, particularly during the latter half of the year. On average about 18 cyclonic storms pass through the archipelago each year (Lander 1994:7). For Guam, each year typically has a 73.5 percent chance of a typhoon passing within 60 nautical miles, and a 38.2 percent chance of one passing within 10 nautical miles (Lander 1994:7).

VEGETATION

The United States Department of Agriculture (USDA) Forest Service defines 21 vegetation and non-vegetation classes for Guam, including limestone forest, ravine forest, scrub forest, *Leucaena* stand, *casuarina* thicket, *acacia* plantation, savanna complex, strand vegetation, other shrubs and grass, coconut plantation, agriculture field, urban built up, urban cultivated, mangrove swamp, marsh land, wet land, bad land, sand beaches and bare rocks, barren, and water (Liu and Fischer 2006).

The majority of the project area is classified as urban cultivated, a class that primarily includes maintained grassy areas around developed areas. A small pocket on the northern edge of the area is classified as urban built-up, a class that includes built-up areas such as buildings, roads, and parking lots. A strip along the southern edge of the project area is classified as scrub forest, a highly variable class resulting from long-term human disturbance to the native vegetation, which often includes breadfruit trees, coconut groves, bamboo clumps, patches of scrub forest, small cultivated areas, and patches of tangantangan (*Leucaena leucocephala*) (Liu and Fischer 2006).

GEOLOGY AND PEDOLOGY

The following discussion is summarized from Tracey et al. (1964) and Young (1988), which provide more detailed discussions of the geology and pedology of Guam. Geologically, there are two distinct physiographic provinces on Guam—a dry, generally flat limestone plateau in the north and a volcanic province of higher, gently rolling uplands and moderate to steep slopes descending into alluvial valleys in the south.

The northern half of Guam is composed of uplifted Neogene coralline limestone, overlying deeper igneous formations deriving from ongoing subduction processes in the Mariana Arc. This coralline limestone is not uniform in age or type. Most of the island's northern interior is composed at the surface of Mariana Limestone, a friable limestone that formed in an epipelagic environment during the Pliocene-Pleistocene (Tracey et al. 1964). Together with the Barrigada Limestone (a Miocene-Pliocene sedimentary unit with a benthic geogenesis), this forms the karstic plateau that comprises the northern half of Guam and represents a "nearly flat constructional platform of reef-associated limestone that has been lifted above sea level and tilted gently southwestward" (Tracey et al. 1964:A62). The plateau rises from an elevation near 60 m in the south along the Adelup-Pago Bay fault line, to greater than 180 m in the north at Mount Machanao and Pati Point.

The geology of southern Guam consists of rugged volcanic highland with some limestone outliers. The oldest exposed rocks are of Eocene and Oligocene age and comprise the Facpi and Alutom Formations, in the highlands from central to southern Guam. These formations contain a series of pillow basalts and pyroclastic rocks ranging from tuffaceous shale to coarse boulder conglomerate and breccia. The Umatac Formation dates to the Oligocene and late Miocene, located on top of the Alutom Formation. It consists primarily of reef and forereef limestone, tuff breccia and volcanic conglomerate, and basalt flows (Tracey et al. 1964:A62–A71).

Soil in the project area is classified as Guam cobbly clay loam (Figure 4), a very shallow, well-drained soil found on limestone plateaus. Young (1988:33), described the typical soil profile of this soil class as follows:

> … the surface layer is dark reddish brown cobbly clay loam about 5 centimeters thick. The subsoil is dusky red gravelly clay loam about 15 centimeters thick. Limestone is at a depth of 20 centimeters. Depth to limestone ranges from 5 to 41 centimeters. In some places, a thin layer of soft, fractured limestone is below the subsoil. The deeper areas commonly are nongravelly, and the shallower areas commonly are very gravelly.

HISTORICAL AND CULTURAL CONTEXT

The history of the Mariana Islands is divided into two broad eras. The pre-Contact era encompasses the initial settlement of the islands and the development of traditional CHamoru culture prior to European contact in AD 1521. The post-Contact era is defined by interactions between the CHamoru and a succession of colonizing powers up to the present day. Each era is subdivided into several periods. The GHRD defines 14 chronological periods for the history of Guam. Table 1 outlines the chronology of these periods, including date ranges and defining characteristics. The general history of the Marianas with a focus on Guam is summarized following the table, organized by era and period, to provide a context for understanding the place of the project area in these broader developments.

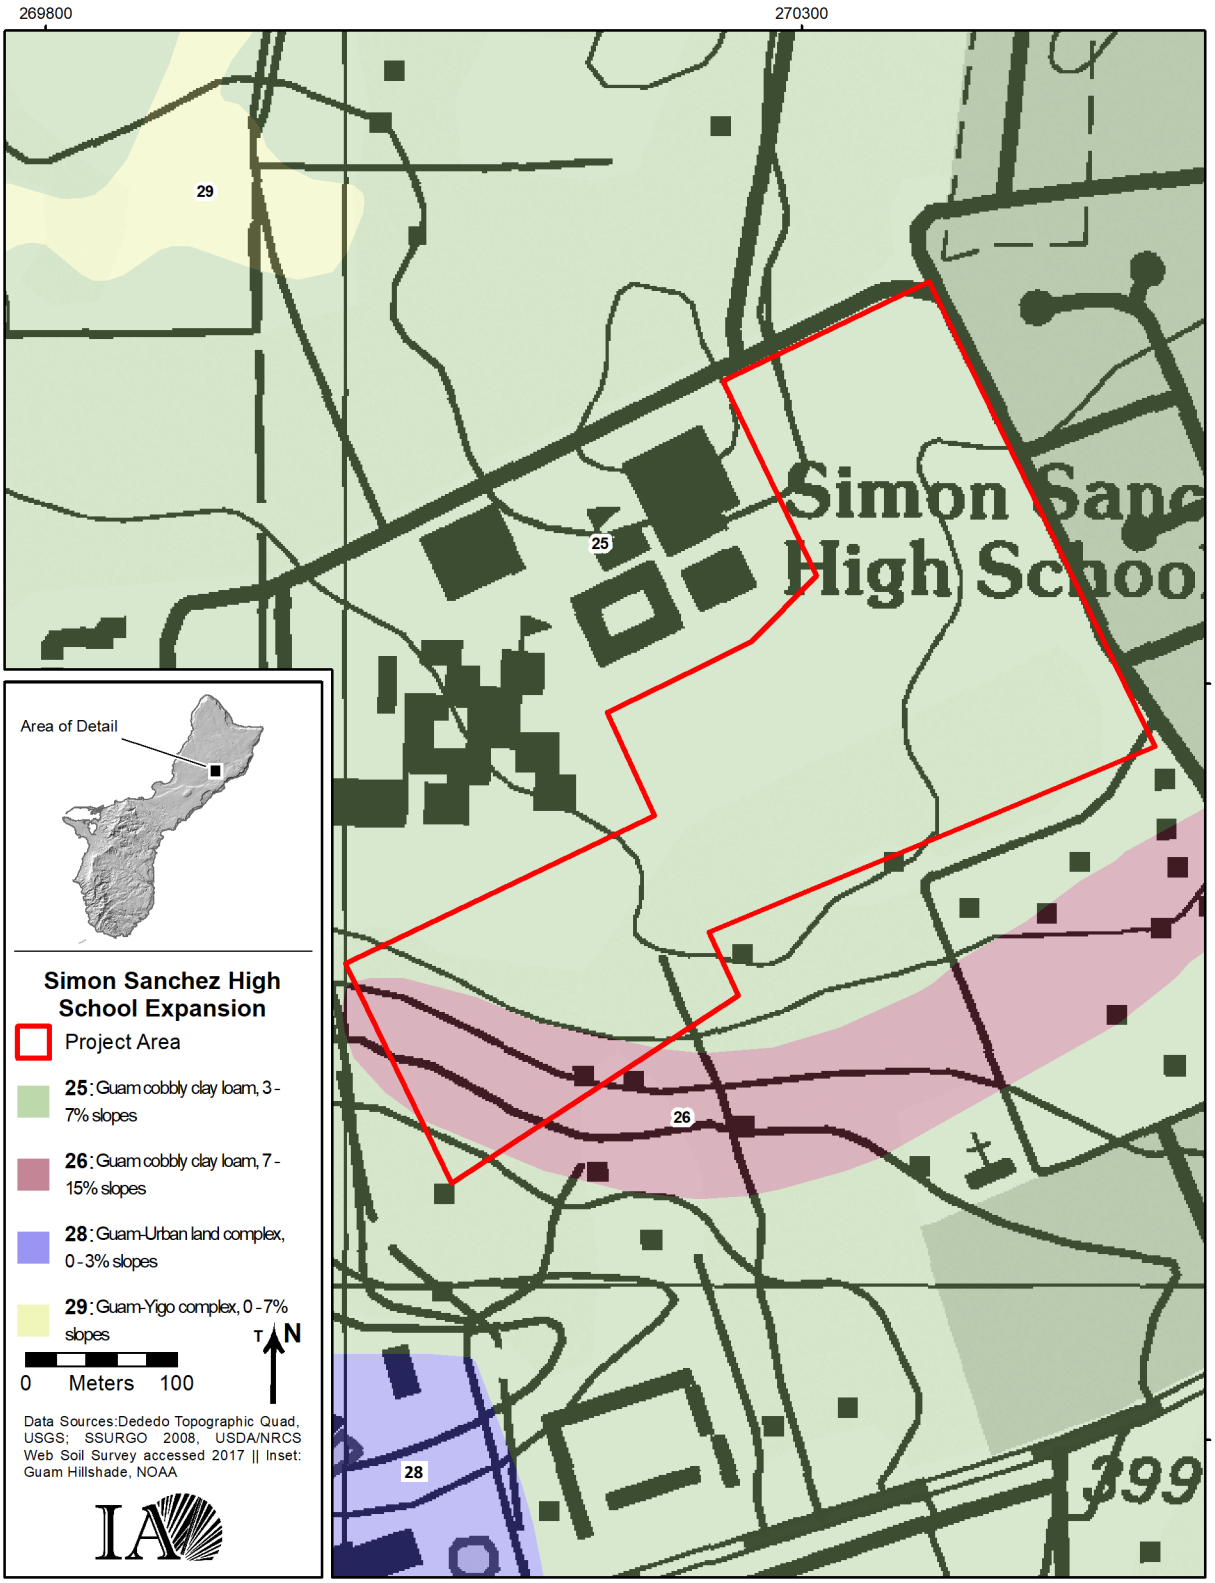

Figure 4. USDA soil classes in the vicinity of the project area (Soil Survey Staff 2021; U.S. Geological Survey 2000).

Table 1. Outline of GHRD-defined Chronological Periods.

Historic Period	Dates	Summary of Defining Characteristics
Early Pre-Latte Period	1500–1000 BC[1]	Thin-walled, typically calcareous sand tempered vessels (rounded jars, carinated jars and bowls, open bowls) with thinned or parallel rims (Type A); red-slipped (Marianas Red or Redware) or black-burnished; incised designs (Achugao and San Roque Incised); shell tools and ornaments common; chert tools; coastal settlement with a marine subsistence focus.
Middle Pre-Latte Period	1000–500 BC	Ceramic vessels on average slightly thicker-walled than preceding period, with calcareous sand and mixed calcareous-terrestrial sand temper; Marianas Redware still common but Achugao and San Roque Incised absent; bolder, impressed, lime-filled designs present; carinated vessels common; coastal settlement focus but archaeological and paleoenvironmental evidence for inland activities.
Late Pre-Latte Period	500 BC–AD 500	Thick-walled, large shallow bowls and pans with Type A rims; mixed sand temper most common; mat impressions and uncommonly Ipao Stamped decoration; deposits dating to this period found on all major islands; coastal settlement focus but expansion along river valleys occurred.
Transitional	AD 500–800	Ceramic attributes transition from unthickened (Type A) to thickened rims (Type B); flat bottomed pans disappear with rounded vessels more common; variety of tempers; typically, undecorated surfaces; open and rockshelter sites along coasts and interiors on all islands; agricultural soils dated to this period; terminal end of the period is marked by appearance of *latte* stone structures.
Early Latte Period	AD 800–1100	Defining characteristics are *latte* structures and thicker, larger vessels (particularly globular pots) with thickened rims; *lusong* and slingstones appear; *Tridacna* adzes become more common; settlement across all islands.
Middle Latte Period	AD 1100–1350	*Latte* structures, ceramics similar to the Early Latte Period; *lusong*, slingstones, and *Tridacna* adzes common; marine subsistence focus; major expansion into inland areas.
Late Latte Period	AD 1350–1521	Similar material culture and site patterning as Middle Latte Period, though with a higher proportion of very thick Type B rims; dense *latte* villages along coasts and suitable interior areas; highly developed agriculture and arboriculture; marine subsistence focus, including pelagic fishing (similar to earlier periods).
Pre-Colonial European Trade Period	AD 1521–1668	Period following Magellan's landing in AD 1521; indigenous material culture remains largely unchanged, but foreign materials such as iron and glass became available in limited quantities as did foreign animals; village settlement and subsistence patterns similar to the preceding period.

Table 1. Outline of GHRD-defined Chronological Periods.

Historic Period	Dates	Summary of Defining Characteristics
Spanish Missionization Period/CHamoru-Spanish Wars	AD 1668–1700	Arrival of Jesuit missionaries and soldiers and a concerted attempt to convert the CHamoru population to Christianity and change local customs; uprisings against Spanish aggression led to years of conflict; following subjugation, the Spanish implemented the policy of *reducción*, which involved removing CHamoru from other Mariana islands and forced settlement in villages in Guam; CHamoru population reduced in numbers through Spanish conflict and introduced diseases.
Spanish Colonial Period	AD 1700–1898	Spanish gubernatorial rule with rigid hierarchical system; settlement restricted to a few major villages; subsistence economy transformed to provide provisioning to galleons and other ships; maize introduced and became a staple crop; Catholicism and the church became fundamental structures for social life and organization.
First American Territorial Period	AD 1898–1941	U.S. Naval administration following the Spanish-American War; Guam served as a remote, but important, transportation and communication node: as a fueling station, site for the trans-Pacific cable, base for a naval radio station, and landing for the Pan-American trans-Pacific air clippers; minimal military defensive development.
World War II—Japanese Military Occupation	AD 1941–1944	Japanese military rule began December 10, 1941, with Japanese forces landing on the island and the U.S. naval commander surrendering; attempts to acculturate the local population to Japanese norms and culture.
Post-World War II/ Second American Territorial Period	AD 1944–1950	The recapture of Guam by U.S. forces resulted in a substantial military build-up of the island's defenses and offensive capabilities; post-WWII the island was administered by the U.S. Navy, but in 1949 a limited civilian government was established and in 1950 Guam was made an unincorporated U.S. territory.
Organic Act/Home Rule/ Economic Development Period	AD 1950–present	Establishment of a local, territorial government including an executive branch, legislature, and judiciary; U.S. citizenship for residents; economic development as a tourist destination after lifting of security clearance restrictions in 1962, as well as a result of a continued U.S. military presence.

[1] Bayesian calibration modeling by Rieth and Athens (2019) and Petchey et al. (2017) suggest that the earliest date for this period should be revised to approximately 1300 BC.

A Brief History of Archaeological Research in the Mariana Islands[1]

The earliest archaeological observations in the Mariana Islands were made by Commodore George Anson in 1742 when his six-ship squadron stopped at Tinian. Anson described the House of Taga ruins and a drawing was made of it by a junior officer. In 1819 a French expedition under the command of Louis de Freycinet stopped in Guam. Freycinet "collected a significant body of data relating to contemporary and ancient Chamorro culture, which he later compiled and published …" (Russell 1998:20). His draftsman, Jacques Arago, also visited the House of Taga on Tinian. Then in 1870, a report by Governor Felipe de la Corte provided observations concerning *latte* sites on Guam, Rota, and Tinian, the latter including the House of Taga. In the 1880s, Antoine-Alfred Marche, another Frenchman, visited the Mariana Islands to collect biological specimens, though he also had an interest in archaeology and the study of ancient societies. As Anson, Freycinet, and Corte had done earlier, Marche visited Tinian and the House of Taga, and he also went to Rota to see the large Mochong *latte* site. Marche then visited the remote Northern Islands, including Agrigan, Pagan, and Alamagan, where he documented *latte* sites and collected artifacts. His collective findings were presented in an 1889 report (Marche 1982). Olive y Garcia, Governor of Guam, produced a report in 1884 at the end of his administration that also included his observations concerning *latte* sites. He brought attention to the odd fact that the earliest Western visitors to the Mariana Island, the Spanish, had failed to note in detail "such notable and visible monuments" (Olive y Garcia in Russell 1998:25). With Germany's acquisition of Micronesia, Georg Fritz was appointed government administrator in

1. This section draws heavily on Russell (1998) and the website Guampedia.com.

Saipan in 1899. He had an avid interest in archaeology and ethnology, publishing his observations in 1904 (Fritz 1989).

The earliest systematic archaeological investigations in the Mariana Islands began with the work of Hans G. Hornbostel between 1920 and 1922 (Hornbostel 1924–1925). Though he was not academically trained, Hornbostel recorded and collected archaeological material over a four-year period in the 1920s under the auspices of the Bernice P. Bishop Museum in Honolulu. His collections amounted to more than 9,000 specimens, including *latte* stones, potsherds, stone implements, and skeletal remains. Hornbostel's wife, Gertrude, who was fluent in the CHamoru language, assisted with the compilation of texts with translations, lists of CHamoru family and place names, field notes on excavations, maps, and photographs. Though Hornbostel left extensive notes concerning his work, he did not formally compile and present his findings in reports and publications. Rather, it was Laura Maud Thompson, an American anthropologist employed by the Bishop Museum in Honolulu, who compiled his notes and collections in the volume *Archaeology of the Mariana Islands*, which was published in 1932 and was the first definitive volume on Guam and Marianas archeology.

Russell (1998:37) considers the work of Alexander Spoehr (1957) as marking the beginning of modern archaeological research in the Mariana Islands. His investigations were confined to surveys and stratigraphic excavations in Saipan and Tinian in 1949 and 1950. The study of pottery by stratigraphic layer was of particular interest to him as he recognized its value for understanding cultural and temporal changes. As a result of this work, Spoehr proposed that the prehistory of the Mariana Islands could be divided into two main phases or periods: a Pre-Latte Period and a Latte Period. The later Latte Period, with its distinctive thick-walled pottery, was associated with the stone *latte* monuments. The earlier Pre-Latte Period had a distinctive thin-

walled Redware pottery, some of which was intricately decorated with various incised designs. Thanks to Willard Libby's work on the radioactive decay of the carbon 14 isotope at that time, Spoehr was able to obtain an absolute time frame for his two periods. The earlier Pre-Latte Period, according to a radiocarbon determination on an oyster shell from a deep archaeological deposit, dated to 3,500 years ago. Another sample, from carbonized wood collected in deposits below a *latte* structure on Tinian dated to roughly 1,000 years ago, establishing the beginning date for the Latte Period. While archaeological research during the past 70 or so years has refined, adjusted, and/or expanded upon Spoehr's findings, his basic work still remains the underpinning of modern archaeological research in the Mariana Islands.

During the 1950s, Erik Reed documented *latte* villages and Spanish Period sites for the U.S. National Park Service (Reed 1952); Douglas Osborne, who was on Guam from 1945–1947, also had conducted a survey (Osborne 1946, 1947), but his work in the region focused mainly on Palau. Later, in the early 1970s, Fred Reinman's careful survey work on Guam documented dozens of *latte* villages and sites in what was, up to that time, the most systematic and thorough island-wide archaeological survey of Guam (Reinman 1977).

As explained by Russell (1998:47), historic preservation programs in the Territory of Guam and the Commonwealth of the Northern Mariana Islands were established in the late 1970s, along with both federal and local preservation legislation and funding. Coinciding with a construction boom largely fueled by Japanese development capital and tourism, the need for archaeological surveys, archaeological data recovery, and related investigations mushroomed to satisfy preservation laws and permit obligations. As the field of archaeology matured, this work brought with it new methodologies, techniques, and research orientations (e.g., paleoenvironmental research). Many of these later investigations are cited in the discussion below.

PRE-CONTACT ERA

The commonly cited date for the initial settlement of the Marianas is 1500 BC, and some researchers argue for earlier settlement in the 17th century BC (Carson 2010, 2012; Carson and Hung 2017; Carson and Kurashina 2012; Guam State Historic Preservation Office 2016; Hung et al. 2011; Russell 1998; Spoehr 1957). However, Bayesian modeling of data from sites with the most robust suites of high-quality (i.e. identified short-lived taxa from secure contexts) radiocarbon determinations suggests initial settlement more likely took place in the period 1280–1135 BC (3230–3085 cal. BP, 95.4% highest probability density) (Petchey et al. 2017; Rieth and Athens 2019). Initial settlement of the Marianas took place in the context of a broader dispersal of people out of Island Southeast Asia (ISEA) into the Pacific; however, the precise ISEA origin of the first settlers of the Marianas remains uncertain. Recent genetic studies using modern and ancient DNA (deoxyribonucleic acid) have produced varied results that may not be contradictory but rather are indicative of a complex migration process and genetically diverse migrants. Vilar et al. (2013:120–121) analyzed modern mitochondrial DNA (mtDNA) from individuals in the Marianas and their findings suggest Sulawesi and the Maluku Islands of Indonesia as the most likely origin of the founding population, which subsequently developed unique mutations in isolation after settlement. Liu et al. (2022), in their analysis of genome-wide data from ancient and modern individuals from the Marianas and other islands of Micronesia, find a homogenous East Asian ancestry for the earliest Mariana Islanders with no Papuan admixture. Later admixture with an initial Palauan lineage is estimated to have occurred between ~2400–1700 BP. Pugach et al.'s (2021) analysis of mtDNA and genome-wide single nucleotide polymorphism (SNP) data from two skeletal samples dating ~2000 cal. BP finds a closest similarity to modern Taiwanese and Philippine samples. Later admixture with an initial Palauan lineage is estimated to have

occurred between ~2400–1700 BP.[2] Pugach et al.'s (2021) analysis of mitochondrial DNA and genome-wide single nucleotide polymorphism (SNP) data from two skeletal samples dating ~2000 cal BP[3] finds a closest similarity to modern Taiwan and Philippine samples. An origin in the northern Philippines has also been argued based primarily on similarities in ceramic decorative motifs (Carson et al. 2013; Hung et al. 2011, 2012), but neither a detailed consideration of the ceramic evidence (Clark and Winter 2019; Winter et al. 2012) nor seafaring simulation models (Fitzpatrick and Callaghan 2013; Montenegro et al. 2016) support this. It has also been argued there was not a single founding population, but a series of groups, possibly from different origins, that visited intermittently and settled at various times during this early dispersal, eventually forming the population that developed traditional CHamoru culture (Hunter-Anderson and Eakin 2016). Evidence related to the initial settlement of the Mariana Islands, and its interpretation, remains in flux.

The original settlers brought with them from ISEA voyaging knowledge, technology, and canoes; a language that shares cognates with other Austronesian languages (e.g., Russell 1998:Table 3); and economic plants believed to have included aroids (taro and its relatives), banana, and yams, which supplemented the scant edible native plant inventory—primarily coconut, cycads, and one breadfruit species (Russell 1998:94). The settlers also brought artifact traditions from ISEA. These included red-slipped and lime-filled incised ceramic wares that resemble, in decorative techniques and sometimes in actual motifs, contemporaneous and earlier

[2] Liu et al. (2022:77) state that the sampled Latte Period individuals post-date 700 BP, and that admixture with the Palauan lineage occurred 45–50 generations prior to that time. Using a 28-year generation time span, the date of this admixture would have occurred about 2400 to 1700 BP (it is unclear if the Liu et al. dates refer to calibrated years before the radiocarbon present [AD 1950]). This problem aside, a five-generation variance in the estimated time for the admixture equates to 140 years and not 700 years as Liu et al. indicate.

[3] Pugach et al. (2021) and Carson (2017), which originally presents the radiocarbon date, also offer problematic date calculations. Without isotopic values to estimate the presumed marine component to the dated individual's diet and without a reliable deltaR value for Ritidian, accurate calibration parameters are uncertain.

ceramics from Indonesia and the Philippines (Hung et al. 2011, 2012; Winter et al. 2012). Other material traits shared by the Marianas and ISEA include ceramic bowl and jar forms and calcareous sand temper, polished stone tools including certain adzes with cross sections found in the Philippines, and shell artifacts (e.g., Thiel 1987).

Developments subsequent to initial settlement are divided archaeologically into three periods based on changes in ceramics and other aspects of material culture over time—the Pre-Latte Period (1500 BC–AD 500), the Transitional Period (AD 500–800), and the Latte Period (AD 800–1521). Defining aspects of the material cultural assemblages, settlement patterns, subsistence, and other aspects of CHamoru culture in these periods are summarized below.

Pre-Latte Period (1500 BC–AD 500)

The best studied feature defining Pre-Latte Period assemblages is pottery. Based on changes in ceramics, the period is subdivided into Early (ca. 1500–1000 BC), Middle (1000–500 BC), and Late (500 BC–AD 500) phases (Leidemann 1980; Moore 1983, 2002). The defining pottery of the Early and Middle phases is the ware type known as Marianas Red. This pottery is a generally thin-walled earthenware tempered primarily with calcareous sand, often made red through the application of a slip, paint, or film, and typically with thinned, vertical or everted (Type A) rims. The most common early vessel forms were small bowls and jars with a carinated shoulder. Although the term Redware has often been preferred since it was coined by Spoehr (1957:117), the term Early Calcareous Ware has also been suggested due to some early authors applying the term Redware inconsistently to different pottery types and the fact that not all of the earliest sherds with the same characteristics are red. Red was the most common color, but gray- or black-slipped sherds and, more rarely, unslipped or buff-slipped sherds are also found. The

black-slipped sherds—as well as the gray, which are likely faded black-slipped sherds—have sometimes been termed separately as "black ware" or "black-burnished" (Butler 1995:171; Carson and Hung 2017:43; Hunter-Anderson and Butler 1995:49–50; Moore 2002:7–9; Pellett and Spoehr 1961:323).

The most distinctive Redware sherds are those bearing decorations, which occur in small numbers at most early sites. The earliest decorative styles are known as Achugao and San Roque incised decoration. The Achugao style consists of pairs of fine, parallel, incised lines, typically in rectilinear designs, but also in curvilinear patterns, with rows of stamped circles between or around the lines and negative space filled with a series of fine dentate punctuations. The San Roque style consists of stamped circles connected by fine, incised lines in curvilinear patterns. Both styles are on the neck of vessels, between the rim and carinated shoulder, and both were often filled with slaked lime to highlight the designs in white. The Achugao style is found in equal frequency on red- and black-slipped sherds, while the San Roque style occurs almost exclusively on red-slipped sherds. Although they are roughly contemporaneous, it appears the San Roque style may have been introduced later or remained in use longer than the Achugao style (Butler 1995:191–202; Moore 2002:7–9).

From the early pottery described above, a number of changes occurred over the course of the Pre-Latte Period. In general, vessels became larger with thicker walls over time, and carinated shoulders gradually disappeared. In the Late Pre-Latte, thick-walled, flat-bottomed shallow bowls or pans were prominent. The function of these vessels is uncertain, and they have been tentatively presented as griddles, earth oven pans, salt drying pans, communal serving dishes, or boat stoves. The frequency of black-slipped pottery decreased early in the period and slipping of all colors eventually disappeared. Temper also changed, as primarily calcareous sand tempers were replaced

by or mixed with volcanic sands in increasing frequency. The Achugao and San Roque incised decorations were replaced first by a style known as Ipao Stamped, which consists of bold lines, circles, half circles, and chevrons in simple patterns, appearing on the shoulder and often lime-filled. This style also disappeared over time, and by the end of the period the only decorations were simple incised or stamped designs along the rim of vessels. The simplification in ceramic vessel forms and decoration over this period may be related to an increase in population, allowing for more vessels to be produced with less effort, but the cause of these changes has not been well studied (Carson 2016:189; Hunter-Anderson and Butler 1995:49–54; Moore 2002:7–12; Moore and Hunter-Anderson 1999).

The early settlement pattern in the Marianas appears to be one of small groups living along sandy shorelines with easy access to marine resources, fresh water sources, and suitable cultivable land. These settlements were established during the mid-Holocene highstand, when sea level was ca. 1.8 m higher than at present (Dickinson 2000, 2001). At that time, many of the current low-lying coastal areas were not available for settlement. The shorelines at the time consisted of fewer sandy beaches and more embayments and estuaries with marshy environments. There is evidence that the earliest settlements consisted of houses built on poles or stilts around these shoreline features and that, while the inhabitants primarily made use of protected fishing and shellfish gathering grounds, they also made forays into the interior to hunt and forage. It has also been suggested that the earliest sites represent only short-term encampments for small groups who visited the islands intermittently—surviving on marine resources during their short stays—but did not found permanent settlements for 500–1000 years after the discovery of the islands (Carson 2016:140–142, 157; Graves and Moore 1985:159–162; Hunter-Anderson and Eakin 2016; Russell 1998:91–100).

Over the following centuries, environmental changes related to the sea level drawdown precipitated changes in settlement patterns, subsistence strategies, and material culture. Settlements shifted inland onto stable backbeach areas, becoming denser and more spatially distinctive. There is evidence of increased use of inland areas and temporary habitation of the interior. A successful, established population is suggested by the increased number of sites and the diversity of settings ranging from open-air locales along or near the coast, coastal and near-coastal caves and rock shelters, and a few inland caves. As the shorelines slowly began to form their present stance, settlements shifted to make use of more stable land along the coast (Amesbury et al. 1996; Carson 2016:183, 187–193, 211, 213).

Pre-Latte Period sites are known on the north, west, south, and east coasts (Moore 1983:45). These include sites at Ritidian (Carson 2017), Tarague (Moore 1983), Ypao (Leidemann 1980), Merizo (Kurashina et al. 1983), Mangilao (Dilli et al. 1998), and the Talofofo River valley (Reinman 1977). Most Pre-Latte sites throughout the Marianas occur along former shorelines, at the bases of cliffs near beaches (e.g., Bath 1986:Fig. 71), or in rockshelters—all located at least 2 m above sea level. The pattern reflects coastal settlement in relation to higher sea levels before ca. 500 BC (Allen 1990; Allen et al. 2002:13; Amesbury et al. 1996; Athens and Ward 1993, 1995, 1998; Dickinson 2000; Easton et al. 1978). An uncalibrated radiocarbon date processed by Reinman (1977:30) for Talofofo provides possible evidence of a move into a major river valley in the south ca. 250 BC, during the Late Pre-Latte phase. Although few inland sites have been documented for the Pre-Latte Period, several rockshelters and caves in the Naval Ordnance Annex along the upper tributaries of the Talofofo River have produced evidence of Pre-Latte occupation (Allen et al. 2002). More recent Bayesian modeling of radiocarbon dates for the Talofofo River

valley indicate initial settlement of the area occurred sometime in the period 310 BC to AD 70 (Tomonari-Tuggle et al. 2018a:70).

Although archaeologists have not recovered any stone habitation remains or other permanent architecture at well-researched Pre-Latte Period sites (Athens 1986; Kurashina et al. 1983; Kurashina and Clayshulte 1983; Liston 1996; Moore 1983), post molds at Tumon (Matapang, Tumon Ball Park) (Bath 1986:50, 116), Ritidian (Carson 2017), Unai Bapot[4] (Carson and Hung 2017), and House of Taga (Carson 2018) suggest former structures were made of wood and thatch.

Compared to pottery, the understanding of the nature and variability of other aspects of the Pre-Latte Period assemblage is less developed, but some trends have been suggested. Throughout the period, and extending into the Latte Period, marine shell, most often *Tridacna*, was the most common material for adzes and other cutting and chopping tools. Alongside this, chert was a common material early in the period, which later declined and fell out of use. Volcanic stone was used at a lower frequency than either shell or chert throughout the period but rose in frequency as chert declined. Beads made of thin ground *Cypraea* shells are found at the earliest sites, but not later. Beads of *Conus* shell were made throughout the period and into the Latte Period, but they became coarser and less polished over time. In general, as with pottery, other types of shell ornaments appear to have become less refined and less labor intensive over time (Carson 2016:111–112, 151–153, 176, 189; Mangold 1998:224).

[4] The commonly used name of this site on Saipan, Unai Bapot, is used here and elsewhere in this document. The grammatically correct term in CHamoru would be Unain Bapot.

The shift in ceramic forms from the early to the later part of the Pre-Latte Period may represent a shift in the preferred cooking method, as the shallow, flat-bottomed pans that became common toward the end of the period would be better suited to baking food in an earth oven rather than cooking on an above ground hearth. A potential shift toward more communal eating among larger groups, and a shift toward greater reliance on terrestrial rather than marine food sources, is also suggested (Moore and Hunter-Anderson 1999). Although Pre-Latte Period foodways have not been well studied, it is likely that plant food sources, both introduced and indigenous, such as breadfruit (*Artocarpus mariannensis*), coconut (*Cocos nucifera*), taro (*Colocasia* sp.), yam (*Discorea* sp.), and others were likely an integral part of the diet during this time (Moore 2015; Russell 1998:165).

Fishing appears to have been important from the earliest part of the Pre-Latte Period. Fishing gear, including J-shaped rotating hooks made of shell and net weights made of ceramic or limestone have been found from the earliest layers through the entire Pre-Latte Period. Possible but unconfirmed trolling lures have been found from the middle of the period. Analysis of faunal remains shows that reef fishes—most commonly parrotfish—made up the largest percentage of individual fish caught. However, pelagic species, which averaged 16 percent of individuals among 10 assemblages studied in detail, undoubtedly accounted for the majority of the weight of fish consumed. Unique among the Pacific Islands, a number of pelagic species are represented among Marianas faunal assemblages, including mahi-mahi, marlin, and tuna (Amesbury 2013; Carson 2016:112, 153–154). Regarding shellfish exploitation, bivalve collection was clearly emphasized during the Pre-Latte Period, in contrast to gastropods that overwhelmingly predominate in Latte Period middens (Amesbury 1999). As discussed by Amesbury, the reason for this change may be

the result of loss of mangrove habitat that gradually occurred with the late Holocene ocean highstand drawdown.

Mortuary practices in the Pre-Latte period are poorly studied compared to those of the Latte Period, as few Pre-Latte period burials—and none from the earliest part of the period—have been excavated. This may be due in part to the same factors that make intact Pre-Latte sites difficult to find and excavate in general. It is also possible that the earliest mortuary practices did not involve internments that would be preserved to the present day, or that burials took place away from residential areas in locations that have not yet been discovered and excavated. It has also been suggested that the lack of discovered burials from the earliest part of the period may indicate that no permanent settlements had yet been established. Nevertheless, some generalizations may be made based on the few burial assemblages that have been excavated. The oldest and largest excavated assemblage of burials from this time is the 155 burials at the Naton Beach site on Guam, which date between 860–410 BC. Most notably, compared to the Latte Period burials from the same site, the Pre-Latte burials had a much higher occurrence of grave goods. This was most commonly *Conus* shell beads and bracelets, but a variety of other items including shark teeth, ceramic vessels, bone tools, fishing gear, and shell adzes were also found. Grave goods were found with burials of both sexes, but beads were more commonly found with female burials. Most burials were in an extended supine position with the feet toward the shoreline. They were clustered in groups of mixed sex in a way that suggested they may have been interred around residences and grouped by kinship, a practice that was later documented by early European visitors to the islands (Carson 2016:193; Hunter-Anderson and Eakin 2016; Walth 2015:283, 320–321, 349–351, 358). A group of Pre-Latte Period burials at the Tumon Ball Park on Guam were similarly arranged around post-molds in a way that suggested they had been buried around residences (Bath

1986:116). On Saipan, 12 burials were excavated in a layer associated with Pre-Latte Period pottery within a rockshelter on Laulau Bay. All were in extended supine position in pits lined on the bottom with beach sand (Spoehr 1957:52–58). It is possible that burial within rockshelters and caves was practiced more widely during the Pre-Latte Period. Late-19th and early-20th century visitors noted the common finding of human remains within caves in the Marianas. However, due to bone collecting by those early visitors, the use of caves by civilians and military personnel as shelters during World War II (WWII), and more recent Japanese war dead recovery missions, most such sites have been heavily disturbed, and it has not been possible to study them (Hunter-Anderson and Butler 1995:58).

Transitional Period (AD 500–800)

The Transitional Period is defined by gradual changes in ceramic attributes from those of the Late Pre-Latte Period to those of the Early Latte Period, with no sharp division between the two (Sant and Lebetski 1988:252). Archaeological evidence suggests continued, though limited, expansion into the Guam interior (Dye and Cleghorn 1990). The typical Late Pre-Latte pottery vessel forms drop out early in this period (Butler 1995:225–226). Lime-filled impressed and incised decorations no longer occur on ceramic vessels (Moore 1983). Wall thickness declines over time and vessels with more rounded bottoms replace the flat-bottomed bowls (Moore 1983; Sant and Lebetski 1988). Hemispherical bowls of widely varying sizes are typical of this period. Volcanic sand temper and mixed volcanic and calcareous sand temper become more common, although apparently not in a simple, temporally continuous pattern. Ceramics associated with the Transitional Period generally have thicker rims. This period does not have a sharp distinction from the Latte Period. However, by AD 1000 ceramics in the archaeological record are more consistent

with those of the Latte Period, and the hallmarks of the Pre-Latte ceramic tradition are no longer seen (Sant and Lebetski 1988:252).

Latte Period (AD 800–1521)

The Latte Period dates from ca. AD 800 until the first contact between the CHamoru and Europeans in AD 1521. The appearance of *latte* structures and changes to the ceramic assemblage are the primary markers of the beginning of the Latte Period, although several other changes to the overall assemblage are also noted. *Latte* are two-part columns consisting of a pillar (*haligi*) topped with a hemispherical capital (*tasa*). *Latte* elements are made of limestone or volcanic stone, and coral heads were sometimes used as *tasa.* *Latte* were arranged in parallel rows to make sets of 6–14 columns that served to support wood and thatch residential structures. The ceramics of the assemblages associated with *latte* are generally thicker and less refined than earlier ceramics, with limited decorations, thickened rims, and a preponderance of large globular vessels. An increase in the number of volcanic stone tools and large volcanic stone mortars (*lusong*) are also characteristic of this period (Hunter-Anderson and Butler 1995:28, 40, 50; Russell 1998:103–108).

The start of the Latte Period is difficult to define chronologically. Although the features described above combine to define the period as an archaeological complex, it appears they developed at different times, and possibly from different sources. The Latte Period ceramic complex was the result of gradual changes from the earlier ceramic types, which had developed into the ceramics typical of the Latte Period by around AD 1000 (Hunter-Anderson and Butler 1995:50). The marked increase in the use of volcanic stone appears to have occurred around AD 950–1150, although the reason for this change is not fully understood (Mangold 1998:224). The appearance of *latte* architecture is often dated to AD 1000, however, most dates reported in

association with *latte* sets are not from contexts directly associated with the construction of the *latte*, and the actual date for the earliest appearance of *latte* is not known beyond the generalized start date for the Latte Period (Tomonari-Tuggle et al. 2018a:73–74).

The Latte Period was a time of expanding settlement patterns, intensifying the use of optimal coastal sites and expanding to interior and more marginal areas, as well as expanding into the islands north of Saipan (Russell 1998:100). *Latte* sets are sometimes found individually but are more often in hamlet or village groups ranging from as small as two to three sets to as many as 50. The majority of *latte* sets have eight columns, and 10-column sets are the second most common. Typically, one 10-stone *latte* set is associated with a cluster of several eight-stone sets. Larger village groups typically consist of *latte* sets arranged in multiple linear rows or of several non-linear clusters (Craib 1986:168–169). *Latte* villages were primarily at or near the coast (Reinman 1977; Thompson 1932), but there were also large inland locations, especially in the southern highland region (Henry et al. 1998a, 1998b; Welch 2010a). Well-known coastal sites include those in Tumon and at Nomna and Tarague; inland *latte* include, among others, those in Manenggon and the Guam Naval Ordnance Annex (Allen et al. 2002; Hunter-Anderson 1994a, 1994b, 1994c; Hunter-Anderson and Moore 2002; Reinman 1977; Thompson 1932). It has been suggested based on data from sites in the Manenggon Hills area of Guam and from the Alaguan and Gampapa areas on Rota that the permanent settlement of interior and marginal coastal sites occurred in pulses, beginning in the 1200s, peaking in the 1400s, and showing a smaller peak in the 1600s, with declines in the 1300s and 1500s (Butler 1997:326; Hunter-Anderson 2012). Hunter-Anderson (2012) suggests the pattern of expansion into inland and marginal areas may be associated with climactic changes due to the Medieval Warm Period, a time of reliable rainfall and

overall good agricultural conditions from AD 800–1350, and the Little Ice Age, a time of frequent drought and less stable conditions from AD 1350–1900.

Latte Period villages supported populations of 100 to 1,000 individuals. The social organization of the residents of these settlements has been described in various ways. European visitors, such as Freycinet in 1819, described three classes of social stratification, with paramount chiefs above all, such as Taga on Tinian (Russell 1998:20). However, it has also been described as being organized around lineages, with important men as their heads or elders (Cordy and Allen 1986:21–22). The largest *latte* stones ever erected are the 16-foot tall stones at the House of Taga on Tinian. Even larger are the partially excavated stones in the quarry at As Nieves on Rota, which would have stood 18 feet tall if erected (Morgan 1988:133, 136). In general, it appears the size of *latte* stones increased over time, and it is thought that these exceptionally large stones were the result of competition between villages. The date these large stones were quarried is unclear, and it has been speculated they were not constructed until the 16th or 17th centuries, perhaps with the aid of iron tools (Butler 1997:323; Craib 1986:174; Hunter-Anderson 2012:164).

Some small, short *latte* uprights found in inland locations, either associated with larger sets or alone (e.g., Allen et al. 2002:85–87, Site 66-02-1661) are interpreted tentatively as supports for field or work structures. Study of two adjacent *latte* structures at the Ritidian site in northern Guam has suggested that single households sometimes utilized multiple *latte* structures for distinct purposes. Artifacts related to subsistence activities were concentrated at one structure, while artifacts related to tool production and other crafts were concentrated at the other. The nature of the artifacts between the two structures may further indicate a gendered divide, with typically male activities taking place at one structure and typically female activities at the other (Bayman et al. 2012).

Changes to the ceramic assemblage are also a signature of the Latte Period. Marianas Plainware, a pottery type characterized by thick walls, rims with thickened lips, no slipping, and minimal decoration, replaced the earlier Marianas Redware. Decoration is limited to incising on vessel shoulders and notches and finger impressions on vessel lips (Moore 2002:12–14; Spoehr 1957:109–116). Clay paste is typically coarse, with a high frequency of volcanic sand temper and less calcareous sand temper. Relatively tall, thick-walled, globular, or conoidal vessels with restricted orifices were common. Butler (1990) suggests that this development of new vessel forms reflects an increased reliance on boiling of starchy foods. The forms and larger sizes of these vessels relative to Pre-Latte ceramics also suggest increased storage capacity for water and food. The Latte Period ceramic complex was the result of gradual changes from the earlier ceramic types, which had developed into the ceramics typical of the Latte Period by around AD 1000 (Hunter-Anderson and Butler 1995:50).

Around the start of the Latte Period, volcanic stone such as basalt and andesite became the predominant material used for stone tools such as adzes, pestles, and scrapers, and large volcanic stone mortars (*lusong*) became common. Sources of volcanic stone are limited in the southern islands of Saipan, Tinian, Rota, and Guam, and it has been speculated that much of the volcanic stone used in the Latte Period was imported from the volcanic islands north of Saipan (Mangold 1998:224; Spoehr 1957:131). However, little research into the sourcing of volcanic stone artifacts from this period has been published, and the reason for the increase in the use of volcanic stone remains unclear. In a study of nine volcanic stone artifacts from Guam, Rota, and Tinian, Mangold (Mangold 1998:228) found that the Umatac Formation in southern Guam was the most likely source for seven of the nine, while the remaining two were sourced from either the Umatac Formation or from the northern islands of Agrigan or Anatahan.

Latte Period subsistence maintained a focus on fishing for both reef and ocean species, and the species represented among faunal remains from this period are similar overall to those from the Pre-Latte, with no confirmable changes over time. Rotating hooks and limestone net weights remain common through the Latte Period, but a number of new items also appear, including V-shaped gorges, trolling lures, and octopus lures (Amesbury 2013; Carson 2016:111–112). Also important were the collecting of other marine resources, agriculture, foraging, and hunting of birds, bats, and lizards. Unlike most other islands settled in Remote Oceania, colonists did not bring pigs, dogs, or chickens (these animals and others were introduced after Spanish contact). Breadfruit (*Artocarpus mariannensis*), yams (*Dioscorea* spp.), and aroids (*Colocasia* sp. and others) were the staple crops during this period. Bananas (*Musa* spp.) and sugarcane (*Saccharum* spp.) were also important. Significantly, rice (*Oryza sativa*) was introduced at this time. Basalt or limestone *lusong* are commonly found at latte sites and may indicate an increased reliance on pounded food processing, possibly including rice and the nut of the cycad (*Cycas micronesica*) (Hunter-Anderson et al. 1995; Moore 2015; Russell 1998:165–196). Shellfish consumption in the Latte Period is notably different than the Pre-Latte Period at most sites, with Latte Period midden deposits comprised primarily of gastropods such as *Gibberulus gibbosus* rather than the bivalves that were favored earlier. This shift is thought to reflect a change in the shoreline environment from the mangrove habitats that supported the previously preferred species such as *Anadara antiquata* to sand flats preferred by *Gibberulus gibbosus.* A notable exception to this is southern Guam, where mangroves persisted and *Anadara antiquata* remained a common species in Latte Period midden deposits (Amesbury 2007).

Mortuary practices in the Latte Period have been well studied, as a large number of burials from this time have been excavated. Burials of this time are most commonly in an extended supine

position interred around or within extant *latte* stones or arranged in a way that suggests they were interred around *latte* stones that have since been removed or around wooden structures. These are often in mixed sex groups, suggesting burial in kinship groups; however, some clusters dominated by male or female burials have been found, suggesting they were possibly buried around a gender-specific dwelling. Grave goods in the Latte Period are less common compared to the Pre-Latte Period and vary in frequency between assemblages (Hunter-Anderson and Butler 1995:57, 60; Walth 2015:347–349, 359). For example, at the Naton Beach site, almost half of the 212 Latte Period burials included at least one item of possible grave goods. These were most commonly shell adzes, but also included fishing gear, ceramic vessels, bone tools, slingstones, and beads (Walth 2015:344–346). At the site of the Imperial Pacific International Casino (Site SP-0762) on Saipan, on the other hand, although some burials contained fishing gear, shell adzes, shell pendants, and *Spondylus* shell beads, the majority of the 418 burials contained no identifiable grave goods. Notable exceptions to this pattern included one burial that was covered in a cache of 150 slingstones, and another with a cache of 29 slingstones (Dega et al. 2017:125, 175). Earlier, unpublished work at the same site recorded two additional burials with large slingstone caches, including one with 460 stones and another with more than 200 (Randy Harper, personal communication 2020). Aside from the most common extended supine inhumations, other less common practices include flexed burials, bundle burials, and cremation. Burial in caves was also practiced, although, for reasons discussed in the previous section, it has not been possible to study this practice in depth. Unique burials have included a woman apparently buried in a canoe and a child buried inside a large ceramic vessel (Dega et al. 2017:176; Hunter-Anderson and Butler 1995:57–61).

Several other common mortuary practices relate to the removal and reuse or reburial of individual skeletal elements. The use of human bone for tool and weapon production is well documented ethnographically and archaeologically, and numerous burials have been documented missing long bones, in particular leg bones (McNeill 2005). Crania were also removed for ritual use by the CHamoru according to ethnographic sources, and numerous burials with missing crania have been found. Occasionally, individual elements were reburied, as isolated crania and groups of long bones have sometimes been found. In one unique case, five additional crania were buried around a single individual (Dega et al. 2017:154; Hunter-Anderson and Butler 1995:60; McNeill 2005; Russell 1998:153).

It has long been suggested that the changes associated with the Latte Period were the result of an influx of new people that brought these new cultural traits with them to the Marianas (Russell 1998:112). Recently, evidence from a study of modern CHamoru genetics has been used to suggest a second migration of people from ISEA during the Latte Period, though a genetic origin of the characteristic B4 lineage inclusive of the C16114T mutation from neighboring Yap and the Caroline Islands cannot be discounted at this time (Vilar et al. 2013). On the other hand, a breadfruit hybrid present in the Marianas (Zarega 2003; Zarega et al. 2004, 2006) has been suggested as evidence of a later migration from the Caroline Islands (Peterson 2012). Conclusive evidence of a second migration has yet to be found, however, and the question remains unanswered at this time.

Traditional CHamoru culture as it had developed up to the end of the Latte Period persisted after European contact, with only minor changes due to interactions with Europeans until the beginning of Spanish colonization efforts at the end of the 17th century, as described in the next section. While written accounts by European visitors of the 16th and 17th centuries provide some

details about CHamoru culture as it existed at that time, it cannot be assumed that those descriptions apply equally to the Latte Period as a whole or to the Pre-Latte Period. Many aspects of the culture described by Europeans may only represent developments from late in the Latte Period, or developments that took places in the century and a half between contact and colonization.

POST-CONTACT ERA

The post-Contact era on Guam is divided into seven periods based on the succession of colonizing nations that have held sway over the island. The Spanish first encountered the Marianas in 1521, and there was a period of intermittent contact and trade between the CHamoru and Europeans until 1668. Spanish colonization began in 1668, followed by conflict with the CHamoru until around 1700. The period of Spanish colonial rule continued until 1898. At that time, Guam was captured by the United States, while the other islands of the Marianas were purchased by Germany. The Japanese military captured Guam in 1941 and controlled the island until it was recaptured by the U.S. in 1944. Guam then remained under U.S. Naval administration until it became an unincorporated U.S. territory in 1950, the status it remains under today. The historical context of each of these periods is summarized below.

Pre-Colonial European Trade Period (AD 1521–1668)

Initial contact between the CHamoru and Europeans took place in 1521 when Ferdinand Magellan's fleet made landfall at Guam during their voyage of circumnavigation. This encounter quickly turned deadly, as the Spanish killed several CHamoru onboard a ship and sacked a coastal village before continuing toward the Moluccas. After Magellan's death in the Philippines, the fleet under command of Gonzalo Gomez de Espinosa stopped twice in the Marianas in their

attempts to return to Spain. Three crew members deserted on Maug at the north end of the archipelago, and one, Gonzalo de Vigo, lived several years on Rota before he was picked up on Guam by the Loaísa expedition in 1526 (Russell 1998:263–268).

De Vigo reported that the CHamoru valued iron highly. His rescuers remained off Guam for six days, trading various iron implements for fresh water and food, setting the precedent for the next 150 years of CHamoru-Spanish interactions. In 1565, Miguel López de Legazpi stopped on Guam for two weeks during his voyage that established the later Manila Galleon trade route. Amid episodes of vigorous trade with and violence against the CHamoru, Legazpi also claimed the islands officially for Spain. Despite this claim, the Spanish did not attempt to colonize the islands for more than a century. Instead, a pattern of short but regular contact with European vessels developed. This included irregular visits by English and Dutch ships but centered on the annual voyages of the Manila Galleons or *La Nao de China* (The China Ship), which were well established by 1600 (Schurz 1939). These vessels, traveling from Acapulco in Mexico to Manila in the Philippines, would typically stop in the Marianas, the only stop on the yearlong voyage. The galleons would stop at Umatac Harbor in southern Guam or drift slowly with the currents through the channel between Guam and Rota and trade with the 150–300 canoes that would come out to meet them from both islands. As in the early encounters, the Spanish would trade iron objects such as nails, knives, hatchets, scissors, and hoop iron for fresh water and food to replenish their supplies after the long Pacific crossing (Driver 1983:198–199; Quimby 2011; Russell 1998:271–289; Schurz 1939; Spoehr 1954:5–8).

A first-hand account of the nature of CHamoru society on Rota early during this period of regular contact with the Spanish is provided by Fray Juan Pobre de Zamora, who spent seven months on Rota in 1602. Although there may have been some differences between the islands, it

is thought this description applies in large part to CHamoru society on Guam at the time as well. Relevant details of his account, translated by Driver (1983, 1988), are summarized in the following paragraphs.

During a voyage from Mexico to the Philippines, Pobre jumped into a CHamoru canoe in defiance of orders from the Spanish authorities that he was not allowed to do mission work in the Marianas. He was taken to the coastal village of *Tazga* on Rota and kept at the home of Sunama, a *mag'låhi*, a word that is often translated as chief, but which Pobre says was applied to several leading citizens in each village. According to Pobre, there were as many as 50 villages on Rota at the time, and a population of 12,000. Life in the coastal villages centered on fishing, with many traditions about how fish were shared among the community and ceremonies involving ancestral skulls to ensure safety at sea and a good catch. He notes that the CHamoru made very fast canoes and had many ingenious techniques for catching ocean fish, such as mahi-mahi, blue marlin, and flying fish. While the men of the villages focused on fishing, the primary activities for women were cooking and weaving leaves to make sails, sleeping mats, mats to eat on, and containers. Although the CHamoru had traditionally made fishhooks out of wood and shell, by 1602 most had replaced these with hooks made out of nails either traded for or recovered from the *Santa Margarita*, a galleon that wrecked on the coast of Rota in 1601. Similarly, they had replaced the stone tools traditionally used to prepare fish with iron knives.

The inhabitants of the coastal villages maintained small farm plots further inland, but it was the inhabitants of the inland villages who focused on agriculture, according to Pobre. In particular, he mentions that they cultivated two types of taro, two types of yams, sweet potatoes, rice, coconut, and breadfruit. Taro, yams, and breadfruit were cooked into a kind of pie, but breadfruit was also eaten roasted or boiled. Sweet potatoes would be mixed with grated coconut

and rice to form small balls, which were sometimes eaten and other times mixed with water to make a drink. Pobre claimed to have taught them how to plant corn alongside their taro. Both men and women took part in tending to their gardens. Unlike fishing, the CHamoru had not adapted iron to their agricultural pursuits and continued to use sharpened sticks for most tasks in the garden. Pobre notes that the inhabitants of the coastal villages were considered of a higher status than those of the inland villages, and that the coastal villages would trade fish for the produce of the inland villages.

Each village had several *mag'låhi,* whose families were accorded special honors and served as village leaders. Also important were the *macanas*, who maintained collections of ancestral skulls and were responsible for healing and rituals to bring good weather. The communities were tightly knit and generous to each other, coming together to erect *latte* and build houses, sharing food with those who were ill and unable to fish for themselves, and generally making sure everyone's needs were provided for. Inter-village relations were generally peaceful. Several thousand people from multiple villages would come together for feasts multiple times a year, where they would also host debates, which sometimes devolved into physical contests or fighting, typically ending once someone was injured. Although typically peaceful and friendly, Pobre noted the CHamoru were highly skilled with spears and slings. He also described how the canoes of different coastal villages raced each other to reach a Spanish ship first to trade with it.

Pobre was not the only outsider living in the Marianas at the time, and he provides an idea of how CHamoru attitudes towards the Spanish had developed. When *Santa Margarita* wrecked, many of the 40 Spaniards who survived the wreck were killed after they threatened the CHamoru, and only 20–25 were left alive. Some of them were rescued a month after the wreck, and more were recovered early in 1602, but at least three remained, spread among Guam, Saipan, and Tinian

during Pobre's stay. In addition to these, at least 18 African slaves from *Santa Margarita* had chosen to stay in the Marianas and hid in the jungle whenever Spanish ships arrived. Pobre was told that the CHamoru considered it a great honor to house Spaniards because they would receive a large amount of iron when they brought them back to a Spanish ship. This was indeed the case for Sunama, who was given iron hoops, knives, scissors, and a monkey when he brought Pobre to a Spanish ship.

As described by Pobre, traditional CHamoru society did not change fundamentally during this first century of regular European contact. Trade with the Europeans was mediated through the inhabitants of the coastal villages, who had long served a similar function in the pre-Contact network of inter-island exchange. Similarly, iron implements were integrated into existing systems—nails were fashioned into fishhooks, drill tips, and awls; knives were used to prepare fish and other food; machetes and cutlasses were used to clear land for agriculture; and hoop iron was fashioned into adzes and other wood working tools (Quimby 2011:12–15). Excavations at *latte* structures at Ritidian (*Litekyan*) have shown those structures were inhabited into the late 17th century. Despite the presence of some European artifacts at the sites, such as glass beads and forged iron fragments, traditional CHamoru lifeways and social organization appear to have persisted at the site through this period (Bayman et al. 2012).

Spanish Missionization Period/CHamoru-Spanish Wars (AD 1668–1700)

The nature of the interactions between the CHamoru and the Spanish changed in 1668 with the establishment of the first mission on Guam by Father Diego Luis de San Vitores. Reactions among the various CHamoru villages to the establishment of the mission and the subsequent work of the Jesuits led by San Vitores were mixed. Some, like Kephuha, a *mag'låhi* who provided land

for the mission in Hagåtña, welcomed the missionaries. Others resisted attempts at missionization, eventually burning churches and killing some of the missionaries. The situation escalated after San Vitores himself was killed on Guam in 1672. The Spanish reinforced the mission with soldiers and a military governor, and violent reprisals against the CHamoru spurred further resistance. What followed was a period of sometimes fierce but intermittent fighting, with some CHamoru supporting the Spanish and others resisting. This culminated in a large uprising on Guam in 1684 while the military governor and many soldiers were away on Saipan. After that uprising was put down, the situation on Guam remained largely peaceful, but it was not until 1695 that fighting ceased throughout the Marianas (Hezel 2015; Quimby 2011:23–26; Russell 1998:291–300).

Between the start of the Spanish mission and the end of the Spanish conquest, the CHamoru population of the Marianas appears to have dropped by more than 90 percent. The population in 1668 is estimated around 40,000, with at least half residing on Guam. By 1710, the total population was recorded as 3,500. The majority of these deaths are attributed to diseases introduced by the Spanish, to which the CHamoru population had no immunity. Two epidemics in 1688 and 1700 were noted as particularly bad. CHamoru deaths during the conflict with the Spanish, on the other hand, are estimated at 110–120 (Hezel 2015, 2021:13–16; Russell and Fleming 1990).

Beginning in 1680, the Spanish instituted a policy of *reducción*—the relocation of the entire CHamoru population to centralized villages on Guam, Rota, and Saipan in order to facilitate the mission efforts. In this, Governor Antonio de Saravia appointed a prominent CHamoru man, Antonio Ayhi, as lieutenant governor to work with other CHamoru leaders around the island to convince the residents of their villages to relocate. Particular villages were chosen based on their size and their previous relationship to the mission efforts, with larger villages that had been receptive to missionization being chosen. In the north, Inapsan was initially chosen because the

other large villages at Ritidian (*Litekyan*), Tarague (*Talågi*), and Hanum (*Hånom*) had shown too much resistance to the Spanish. However, the church at Inapsan was soon burned down and the Spanish removed it from the list of resettlement villages, leaving no official village in the north. On the east coast, the inland village of Mapupan was initially chosen, but the church closed within two years and Pago (*Pågu*) was selected as a replacement, as the other villages on the east coast had shown too much resistance. Hagåtña, already a prominent village prior to *reducción*, became more prominent during this time, and no villages on the northwest coast north of Hagåtña were selected for resettlement. Agat (*Hågat*) was selected in the southwest, as the other villages of that part of the coast had shown too much resistance to the Spanish. Fina, inland of Agat (*Hågat*), was also selected, but its residents slowly moved away to coastal villages in the following years. Umatac (*Humåtak*), prominent as the landing place for the yearly galleon, was selected as the resettlement village for the south. Although not named as resettlement villages initially, Merizo (*Malesso'*) and Inarajan (*Inalåhan*) in the south were added as they grew in size to house CHamoru relocated from the northern islands. By the end of the process in 1700, there were six major villages on Guam: Hagåtña, Pago (*Pågu*), Umatac (*Humåtak*), Agat (*Hågat*), Merizo (*Malesso'*), and Inarajan (*Inalåhan*). This policy of *reducción* extended across the Mariana islands, resulting in the relocation of CHamoru from northern islands to Guam, with the exception of those on Rota and Saipan, although Saipan too was abandoned by 1731 (Hezel 2021:12–16, 21; Tomonari-Tuggle et al. 2018b:79–81).

The society that developed after the *reducción* has been described as "neither indigenous nor imported, but a blend of old and new," (Spoehr 1954:24). Society was reorganized around the Catholic church and the Spanish governmental system, but these came to reflect CHamoru influences. Those who held authority and influence in the traditional structures were recognized

with official Spanish titles and retained influence in the villages. CHamoru relocating to new villages worked in the traditional matrilineal system to arrange for new land to live on. The CHamoru were also allowed to retain rights to their family land at their previous villages. The pattern that developed in this time of living in the centralized villages but farming at ranches or *låncho* on land outside the villages—the village-*låncho* system—remained the basic structure of CHamoru society into the 20th century. *Latte* structures also remained in use for a time, in some cases serving as residences and in others as storehouses for family valuables. Although new crops and tools were introduced, many continued farming their traditional lands at *låncho* or ranches outside the villages, and reef and lagoon fishing remained important. Catholicism in the Marianas took on a special character, with traditional feasting practices becoming associated with Church feast days and particular rituals practiced to celebrate the dead and placate harmful spirits (Atienza 2014; Hezel 2021:22–27, 39–42).

Traditional material culture was augmented and eventually replaced by newly available Spanish items, but the changes during this time are not well studied archaeologically. New crops and domesticated animals were certainly introduced in this time, as were new farming and fishing tools, as well as the tools for other crafts such as weaving, blacksmithing, masonry, or carpentry. Items of Spanish origin such as kiln-fired potsherds, nails, beads, porcelain, metal tools, *metates* (grinding stones), beehive ovens, and metal pots have been found. However, due to a general lack of excavation at sites dating to this time, little can be said about when particular items were adopted for use by the CHamoru, when more traditional items were abandoned, and what the typical material cultural assemblage from this time would consist of. Beginning in this period, traditional CHamoru seafaring knowledge and technology was lost as the Spanish reorganized the society

and, in some cases, physically destroyed canoes to stop CHamoru from Guam from fleeing to the northern islands (Spoehr 1954:31–37; Tomonari-Tuggle et al. 2018a:86–90, 2018b:93).

Spanish Colonial Period (AD 1700–1898)

Over the next 100 years, the Spanish government on Guam was primarily concerned with protecting its military and commercial interests by facilitating the Manila galleon trade and preventing other colonial powers from making use of the islands. The government forced the CHamoru population to grow cash crops, such as tobacco, and tend livestock on Jesuit Farms (*Estancias Jesuiticas*) and royal-owned land,[5] as well as requiring a labor tax (*apluy*) of 40 days per years for other projects. Development was focused on structures important to the government, such as churches, forts and other military buildings, government offices, and the development of Apra Harbor. The road along the west coast connecting Hagåtña to other villages was also improved with gravel paving and bridges, coming to be called the *Camino Real* or royal road (Hezel 2021:32; Tomonari-Tuggle et al. 2018b:93, 98).

The CHamoru population reached a low of 1,700 in 1722, but steadily grew over the century, reaching 4,000 by 1800. At that time, although the majority of the population resided in Hagåtña, the villages of Agat (*Hågat*), Inarajan (*Inalåhan*), Merizo (*Malesso'*), Pago (*Pågu*), and Umatac (*Humåtak*) remained inhabited. The northern part of the island had no permanent villages at this time. Apart from their work on the Jesuit and royal farms, most CHamoru retained private *låncho* outside the villages, where they farmed to provide for their families and produce small surpluses to barter for items they could not produce themselves. Fishing also remained important during this time. Despite other changes later in the period described below, this essential pattern

[5] The Jesuit Farms themselves became royal farms after the expulsion of the Jesuits in 1769.

of residing in villages but working government lands and private *låncho* outside the villages remained in place through the rest of the Spanish Colonial Period (Liston 1996; Tomonari-Tuggle et al. 2018b:93, 96, 98).

The situation for the Spanish government changed in the early 19th century, with revolutions in colonies in Central and South America. As a result, the Manila galleon trade ended in 1815, and the administration of the Marianas shifted from Guam to the Philippines in 1817. A further turning point came in the middle of the century, with a massive earthquake and crop failures in 1849 and a smallpox epidemic that killed more than 40 percent of the population in 1856. Despite this, the population grew through the century, and demographics and settlement patterns shifted. At the time of the 1818 census, the total population of Guam was recorded as 5,229, with 1,960 CHamoru. Sixty percent of the population at the time resided in Hagåtña, which had a population that was 55 percent Filipino, 30 percent Spanish, and only 11 percent CHamoru. The other villages, by contrast, were almost entirely CHamoru. At the time, there were five villages near Hagåtña—Tepungan (*Tipungan*), Asan (*Assan*), Anigua (*Aniguak*), Sinahagna (*Sinahånña*), and Mongmong—as well as five others around the south end of the island—Pago (*Pågu*), Inarajan (*Inalåhan*), Merizo (*Malesso'*), Umatac (*Humåtak*), and Agat (*Hågat*). Each had a number of associated royal farms and *låncho*, with much more privately cultivated land (approx. 30,705 ha.) than government land (approx. 5,606 ha.). By the end of the century, Hagåtña had grown to a population of 5,979, now encompassing the five former nearby villages. Pago (*Pågu*) had also been abandoned after a typhoon in 1857. The demographics of the island also changed, first with an increase in Filipino immigration, and later with the arrival of Carolinians (*Refaluwasch*). The first Carolinians came to the Marianas from islands in the present-day Federated States of Micronesia, such as Lamotrek and Satawal, after their islands were devastated by Typhoons around

1815. The first groups settled on Saipan, but later groups also settled at the *barrio* of Maria Christina on Guam and, for a short time, on Tinian. The Carolinians resettling Saipan were followed later in the 19th century by some CHamoru as well. With the growing population on the other islands, the Carolinians became the primary source of interisland communication during this time (Spoehr 1954:39–43; Tomonari-Tuggle et al. 2018b:105, 134–138, 160, 171).

First American Territorial Period (AD 1898–1941)

In 1898, during the Spanish-American War, the U.S. cruiser *Charleston* entered undefended Apra Harbor, and the U.S. quickly took control of the island. As part of American annexation, the U.S. Navy controlled the island until 1941, improving sanitation, roads, health care, and education, but with a focus on the military usefulness of the island. A 1901 census documented 9,576 inhabitants of the island with the large majority in "Agaña and its dependent villages" (Safford 1905:137). For most CHamoru, settlement followed the village-*låncho* pattern (Safford 1905:123–124; Wheeler 1900:8). Tomonari-Tuggle et al. (2018b:206) write that by 1940–1941, "Economic development had brought some material success to CHamoru, including access to automobiles, and the population of CHamoru had significantly increased since 1901." The 1940 census (Beales 1941) lists a total population of 22,290 of which 20,177 were CHamoru. By this time, the island had been divided into 15 municipalities, an increase from the six districts that had previously structured government administration (Tomonari-Tuggle et al. 2018b:207).

During this period, one of the worst epidemics to hit Guam occurred when influenza, which had been occurring worldwide, was bought to the island aboard the U.S. Army Transport (USAT) *Logan*. The epidemic of 1918–1919 killed 858 people, estimated as 6 percent of the population

(Rogers 1995). Older CHamoru were particularly affected and it was estimated that "80 percent of CHamorus who spoke Spanish died in the influenza epidemic" (Rogers 1995:143).

Alongside economic development, U.S. interests in this period were focused on the usefulness of Guam, and Apra Harbor in particular, to the U.S. Navy. Under U.S. naval rule, CHamoru life was heavily regulated in an attempt to Americanize the population. This particularly took the form of attempts to change the traditional subsistence-based agricultural system to produce surpluses to support Navy personnel and to educate the CHamoru population to serve in low-level positions in the naval administration. Changes during the period were evolutionary rather than revolutionary, however, as the CHamoru accepted or adapted some new practices but rejected or resisted others, and society took on a somewhat Americanized, but distinctly CHamoru, nature (Hattori 2014).

Given its importance to the U.S. Navy, the area of Apra Harbor was improved in many ways during this time. The Piti Channel was cleared, the wharf at Piti was extended, and a small Navy yard was built inland of the wharf. A causeway was built connecting Cabras Island to the mainland, and a coal storage facility and quarantine station were built on Cabras Island by 1914. Major improvements were made in 1941, including new breakwaters, sea plane facilities, and fuel storage tanks and an oil dock on Cabras Island. The harbor was defended for a time by guns on Cabras Island and Orote Point, but these were removed in 1931 (Moore and Hunter-Anderson 2005:16–18).

World War II–Japanese Military Occupation (AD 1941–1944)

During WWII, on December 8, 1941, shortly after the assault on Pearl Harbor (December 7 in Hawai‘i), Japanese planes attacked Guam. On December 10, Japanese forces landed on Guam,

and within hours the American naval commander surrendered. Most CHamoru fled to *låncho* in rural areas at the start of the Japanese attack, and Hagåtña was practically abandoned. Around one-quarter of the residents eventually returned, but most remained in the rural areas. The Imperial Japanese Army left in 1942, and the Imperial Japanese Navy administered the island through a civilian administration department. The Japanese naval administration attempted to assimilate the CHamoru population with Japanese language and cultural education, but this was largely unsuccessful. Those living in the rural areas were required to provide food to the Japanese administration in addition providing for their own subsistence. The Japanese also organized communal farms to supply food for the administration, requiring around 8,000 CHamoru to work these farms (Tomonari-Tuggle et al. 2018b:229–232).

In 1944, under the increasing threat of U.S. invasion, the Japanese Army resumed control of the island. Many CHamoru were forced to work on government run farms or on defensive construction projects, however, 5,000 to 10,000 CHamoru were placed in concentration camps (Sanchez 1979; Tomonari-Tuggle et al. 2018b:237).

On July 8, 1944, as a step in the Marianas campaign, U.S. ships and planes commenced intensive bombardment of Guam, which continued for 13 days. On July 21, American Marines landed at Asan Beach, beginning the ground campaign to recapture the island. The last defensive positions of the Japanese at the north end of the island were attacked between August 8 and 10. By August 10, all organized resistance ended (Lodge 1954). However, the caves in the Tarague cliff line as well as other locations throughout Guam, especially at what is now the Navy Ordnance Annex, provided shelter to Japanese stragglers, both military and civilian, who continued resistance for months, even years, thereafter (Denfeld 1997:206–206; Dixon et al. 2013). Most resistance was unorganized, but there were two small organized groups of infantry soldiers, the

latter surrendering on September 4, 1945, after the emperor of Japan broadcast his order to surrender. By that time over 1,200 Japanese troops had surrendered (Denfeld 1997:205–206; Dixon et al. 2013:112). But even afterward, stragglers continued to be captured or killed. The last three holdout stragglers were found as late as 1960 and 1972.

World War II/Post-World War II/Second American Territorial Period (AD 1944–1950)

The recapture of Guam was followed on the one hand by a massive U.S. military buildup and, on the other, by the civilian population attempting to rebuild their lives shattered by the war. As Lodge (1954:164) writes, by the end of WWII in 1945:

> … the entire face of Guam had been changed. A busy naval operating base occupied Apra Harbor, and Navy planes crowded the fields at Agana and on Orote Peninsula. On the northern plateau, B-29's of the Twentieth Air Force rested on fields bulldozed from the jungle … on the heights above Agana was the advance headquarters of the Pacific Fleet.… Scattered throughout the island were vast naval and military supply installations.

The situation for the CHamoru population returning from the Japanese concentration camps varied across the island. For those in the south, where the villages were little damaged by the war, life returned quickly to normal; those in the north more often found a landscape of flattened buildings, stripped of trees and soil, and littered with grenades, bombs, and other military debris. Alongside the vast areas set aside for the military, U.S. military planners allocated a number of areas for civilian resettlement and farming, and constructed a number of resettlement villages, including at Agaña Heights, Agat, Barrigada, Dededo, Santa Rita, Sinajaña, Talofofo, and Yona. Many of the several thousand houses built by the military government and by the

CHamoru themselves during this time remained in use until they were destroyed by a typhoon in 1962. Hagåtña, where most former residences had been destroyed, was developed largely as a military colony, with some civilian settlements, but primarily military structures. Alongside new residences, the military administration also worked to build new churches, hospitals, schools, and transportation facilities, and to rehabilitate agricultural areas (Tomonari-Tuggle et al. 2018b:246–254).

Organic Act/Home Rule/Economic Development Period (AD 1950–Present)

After the end of WWII, Guam was under U.S. naval administration until 1949, when a civilian government was established. The Guam Organic Act went into effect in July 1950, establishing Guam as a U.S. territory and allowing limited self-government. Although many U.S. military installations had been deactivated in the years following the end of WWII, land totaling almost 36 percent of the island was retained for U.S. military use prior to the implementation of the Organic Act. The onset of the Korean War in 1950, Cold War competition with the Soviet Union, and the Vietnam War from 1964 to 1975 spurred ever-increasing military development on Guam, which has continued through the present day (Aaron 2011:3–16–18, 3–23–25, 3–32–33, 3–37–45; Rogers 1995:222, 230).

Alongside the military development of the island during this time, civilian development also increased due to economic growth. New economic growth through tourism was made possible primarily through the lifting of strict military clearance requirements to enter the territory in 1962. New concrete houses were built in many parts of the island in subdivisions of single-family homes spreading out from the traditional village centers. Hotels also became more common along the

coast to serve the growing tourist market, particularly from Japan (Rogers 1995:247–249). This pattern of development has continued to the present.

HISTORICAL LAND USE

Little detail is available about the precise use of the project area prior to the construction of Simon Sanchez High School; however, the general pattern of land use in the surrounding area provides an idea of how the project area may have been used in the past.

Prior to the arrival of the Spanish, it appears one or more traditional CHamoru villages were located in the vicinity of the project area. The Lopez map of 1676 shows several village names inland of Pagat Point, including Hinani, Ypahon, Tapis, and Machauti (Figure 5). A church was built at Pagat in 1672, with its parish including the villages near the project area, but it was destroyed during a CHamoru uprising later that decade. It is not clear if the church at Pagat was ever rebuilt, and it was certainly no longer in existence by 1690, when the entire northern plateau had been depopulated through the *reducción.* Initial attempts at *reducción* in the north were complicated by the fierce resistance to the Spanish from many of the northern villages. Inapsan was first selected as the primary *reducción* village, as Spanish misisonaries had been killed at the other large villages of the north at Taragüe (*Talågi*) and Ritidian (*Litekyan*), but the church there was burned and most of the CHamoru of that village fled to Rota. Hanum (*Hånom*), northwest of the project area, was then selected but abandoned after one of the bloodiest battles between the Spanish and CHamoru took place there in 1679. This left the north without an official resettlement village, and the inhabitants of the area would eventually be moved to villages in the south (Tomonari-Tuggle et al. 2018b:42–54, 80–81; Hezel 2021:13–14). Due to the imprecision of the Lopez map, it is not clear if the project area was within any of the traditional villages shown on

the map or how exactly the area was used during this time. Any villages that did exist in the area would have been abandoned during the *reducción*.

No major developments are documented historically near the project area through the 18th and 19th centuries. Maps from this time (Figure 6 to Figure 8) indicate the area was heavily wooded but show several roads and/or trails through the area. Several place names, including Mataguac, Yigo, and Asatdas, are shown in the vicinity, possibly indicating locations used for ranching or agriculture, but it is not clear what activity, if any, took place within the project area itself during this time.

The same pattern of land use continued through the middle of the 20th century. Maps from this time (Figure 9 and Figure 10) show numerous roads and trails around the project area, and several place names, including Mataguac, Asatdas, Asdonlucas, Yigo, and Sabanan Palie. A trail passing through the northern part of the project area is shown on the 1914 map, but not later. A road is shown in the southwest corner of the project area on the 1914 and 1944 maps, but not later. The overall increase in trails and named places in the 20th-century maps as compared to earlier maps appears to correspond to increased farming and ranching activity in the area. This is supported by records from the late 19th century, such as the 1887 description by Governor Olive y Garcia, which states that many ranches and farms were located on the northern plateau by that time. More permanent settlement in the area also increased during this time; by 1940, records show 324 people resided in the Yigo area (Tomonari-Tuggle et al. 2018b:172–173, 192, 208–209). Apart from the trail and road, it remains unclear what activity took place within the project area itself during this time, although it may have included farming and/or ranching.

Most CHamoru fled from the villages in the south when the Japanese began bombing the island in 1941, with many taking refuge in *låncho* in the Yigo area, possibly including the project area. Many remained in the area for several years, farming and foraging to survive. In 1944, shortly before the U.S. invasion, the Japanese forced CHamoru in the area to march south to the Manenggon concentration camp, with many dying along the way (Workman and Haun 1995:36; Tomonari-Tuggle et al. 2018b:230, 237). During the battle for Guam, the U.S. Marines 77th Division advanced near the project area on August 5–6, 1944 during their drive north toward Mt. Santa Rosa (Figure 11). Although they faced Japanese resistance numerous times during the advance through this area, no significant battles are noted within the project area itself (Lodge 1954:145–147).

Following the Liberation of Guam, the U.S. military developed facilities to the north (Andersen Air Force Base) and south (Mariana-Bonin Islands [MARBO] Base Command) of the project area, but the immediate vicinity of the project area was reserved for CHamoru farms according to a 1944 U.S. Navy development plan (Tomonari-Tuggle et al. 2018b:248). A 1953 aerial photograph (Figure 12) and 1954 map (Figure 13) show the project area remained wooded and undeveloped at this time, despite the nearby military developments.

Simon Sanchez High School opened on the property as a middle school in 1974, and was converted into a high school in 1981. Most of the property is cleared and leveled at this time apart from a small strip on the south edge of the property, which remains covered in vegetation (see Figure 3). Alongside this, numerous housing developments have been constructed in the vicinity of the project area in the past 40 years.

PREVIOUS ARCHAEOLOGICAL RESEARCH

Ten previous archaeological investigations have been completed in the vicinity of the project area; however, none overlapped with the project area (Figure 14; Table 3). Two known sites are located within 400 m of the project area (Figure 15; Table 3). The findings of previous projects in the vicinity and the known sites are described below. Previous evaluations of National Register of Historic Places (NRHP) eligibility are noted where applicable.

In 1986, Moore conducted an archaeological inventory survey of a 19 ac. area adjacent to the project area (Moore 1986). The area was subject to pedestrian survey. The survey identified many bulldozer push piles and modern refuse, such as glass, plastic, tin roofing, tires, and automobile parts, indicating significant modern disturbance to the area. Two large cement slabs were documented in the southern part of the project area. The slabs were determined to be historically insignificant, although they may have been related to the MARBO Base Command area to the south. A scatter of four Latte Period ceramic sherds in a 2 by 0.5 m area was identified, along with five other Latte Period sherds scattered more widely nearby. The Latte Period ceramic scatter was designated as GHPI Site 66-08-0221; however, it was evaluated as ineligible for the NRHP due to its small size and the disturbed nature of the area (Moore 1986:1, 8–12). The site area has since become a residential development.

In 1987, Kurashina, Williams, and Loft-Williams conducted an archaeological inventory survey of a 14 ac. area at the site of the Yigo Garden Subdivision, 75 m northeast of the project area (Kurashina et al. 1987). The area was subject to pedestrian survey at an average spacing of 23 m. The survey identified surface scatters of Latte Period ceramics in nine locations. Most locations had fewer than five Latte Period sherds, often mixed with sherds of historic ceramics; however, one location contained a denser concentration of 46 Latte Period sherds in a thin layer

of clay, which was present along the western edge of the project area. The survey also identified a modern concrete house foundation. Based on the lack of surface features, this survey determined the area was not the site of permanent pre-Contact settlement but was used in some limited way during the Latte Period. The survey report recommended subsurface testing at the locations of the surface scatters. The lack of additional reports for this area at the time of writing indicates that recommended testing did not occur. Therefore, the nature of the Latte Period use of the area remains unclear. None of the surface scatters were designated as sites, and their NRHP eligibility was not evaluated (Kurashina et al. 1987:7–12).

In 1993, Paul H. Rosendahl, Ph.D., Inc. (PHRI) conducted an archaeological inventory survey of a 34 ac. area at the site of a proposed multifamily housing unit project 390 m northwest of the project area (Workman and Haun 1993). The area was subject to pedestrian survey. The survey identified two trash dumps, an animal water trough, and a house foundation, all dating to the post-WWII period (GHPI Sites 66-04-1328–66-04-1331). All were evaluated as NRHP-eligible under Criterion D for their potential to provide information about the post-WWII; however, no additional work on the sites was recommended as the data collected during the survey was deemed sufficient to mitigate any adverse effects (Workman and Haun 1993:27, 32).

In 1994, PHRI conducted archaeological monitoring of mechanical clearing of a 4.5 ac. area at a site 570 m east of the project area (Workman and Haun 1995). The depth of earthmoving associated with the project is not noted in the report, but was likely shallow due to the nature of the project as mechanical clearing rather than excavation. The project found several features associated with a ranch used from the 1960s to the 1970s, but no other cultural resources (Workman and Haun 1995:36).

In 2007, International Archaeological Research Institute, Inc. conducted archaeological survey of a number of U.S. military areas, including 1,700 ac. of the Andersen South area 585 m southwest of the project area (Welch 2010a and 2010b). Survey included ground-truthing of WWII and post-WWII military features associated with the former MARBO Base Command area (Site AS-2007-T-1/Map No 1066) and pedestrian survey of the entire Anderson South area. The survey identified and documented numerous WWII and Post-WWII features in the area. The survey also identified several Latte Period artifact scatters, all more than 1 km away from the project area. MARBO Base Command area is the only site documented during this survey that is within 400 m of the current project area. Although little original construction remains at this site, and it has generally lost integrity of design, more research was recommended before making a final determination of NRHP eligibility (Welch 2010a:48, 311–322).

In 2008, TEC, Inc. conducted surveys of an area 400 m south of the project area in Andersen South (Dixon, Walker, and Carson 2011). This included ground-truthing survey of approximately 60 ac. in the northeast corner of the MARBO Base Command area (Site AS-2007-T-1) and intensive pedestrian survey and limited subsurface testing of approximately 165 ac. on the eastern edge of the area. Subsurface testing was conducted via shovel testing at identified surface features. The strategy for determining the number and placement of shovel test pits is not discussed in the report. Shovel test pits were excavated to bedrock, typically at a depth of less than 50 cm. The ground-truthing survey confirmed the location and condition of concrete pads, roadbeds, and other known features of the MARBO Base Command area. The survey and subsurface testing found pre-Contact material—including *latte* stones; *lusong;* and surface scatters of Latte Period Ceramics, stone, and shell artifacts—in eight locations, all at the south end of the survey area, approximately 2 km south of the project area. All were in secondary context, with

little to no subsurface material in shovel testing and probing. They found little potential for subsurface deposits due to the shallow depth to bedrock (Dixon, Walker, and Carson 2011:15).

In 2010, TEC, Inc. conducted an archaeological inventory survey of utilities and road-widening areas along highways in northern Guam, including a corridor parallel to Route 1 475 m south of the project area (Dixon, Walker, and Schaefer 2011). The corridor was subject to pedestrian survey. The survey did not identify any cultural resources in this corridor (Dixon, Walker, and Schaefer 2011:2-44).

In 2013–2014, Naval Facilities Engineering Command (NAVFAC) Pacific conducted archaeological inventory survey on a number of areas to fill in gaps in previous surveys related to the proposed Guam and Commonwealth of the Northern Mariana Islands (CNMI) military relocation (NAVFAC Pacific 2015). This included an approximately 0.2 ac. area 390 m south of the project area that was subject to pedestrian survey. The survey did not identify any cultural resources in this area (NAVFAC Pacific 2015:2-3, 15-16–15-17).

In 2015, Southeastern Archaeological Research, Inc., conducted a historic inventory survey of approximately 13 ac. in the MARBO Base Command area (Mohlman 2015:288–308), documenting 11 facilities dating from 1945 to 1961, all of which were ineligible for the NRHP.

In 2020, IA conducted archaeological monitoring of construction activities in a 470 ac. section of Andersen South, including a spur 360 m south of the project area (Hlatky and Maxwell 2019). Work on this project is ongoing, and the depth of excavation associated with monitoring is not yet reported. This project has identified a number of new areas with Latte Period material, all of which were located 2.5–4 km from the project area, but no cultural resources were found in the sections closest to the project area (Hlatky 2020:2–5).

Table 2. Previous Projects within 400 m of the Project Area.

Reference	Project Type	Subsurface Testing	Findings	Historical Context of Findings
Moore (1986)	Pedestrian Survey	No	Latte Period ceramic scatters; concrete slabs (possible WWII)	Latte Period; WWII
Kurashina et al. (1987)	Pedestrian Survey	No	Scattered Latte Period ceramics; historic ceramics; post-WWII house foundation	Latte Period; post-Contact; post-WWII
Workman and Haun (1993)	Pedestrian Survey	No	Post-WWII house foundation, animal trough, and dumps	Post-WWII
Workman and Haun (1995)	Archaeological Monitoring	No	Post-WWII ranch features	Post-WWII
Welch (2010b)	Pedestrian Survey	No	WWII military foundations and roads; Latte Period artifact scatters	Latte Period; WWII
Dixon, Walker, and Carson (2011)	Pedestrian Survey; Shovel Testing	Yes	WWII military foundations and roads; *latte* stones, *lusong* mortars, and Latte Period artifact scatters in secondary context	Latte Period; WWII
Dixon, Walker, and Schaefer (2011)	Pedestrian Survey	No	No findings	N/A
NAVFAC (2015)	Pedestrian Survey	No	No findings	N/A
Mohlman (2015)	Historical Architectural Survey	No	WWII and post-WWII structures	WWII; post-WWII
Hlatky (2020)	Archaeological Monitoring	No	Latte Period artifact scatters and combustion features	Latte Period

III. METHODS

This section presents the research questions and expectations that guided the project and describes the field and laboratory methods that were employed.

RESEARCH QUESTIONS

The primary purpose of the survey was to determine the presence or absence of cultural resources in the project area, in particular late pre-Contact and early post-Contact resources as resources from other time periods were not expected. All encountered cultural deposits or historical sites would be assessed in terms of chronology of occupation, extent, significance, and NRHP eligibility. The following research questions were posed in the research design:

1. **What was the nature of the late pre-Contact and early post-Contact use of the project area, if any?**

   Previous research on Guam's northern plateau has typically found only sparse traces of settlement and other land use during the end of the pre-Contact and beginning of the post-Contact eras. This may accurately reflect very limited use of the interior of the plateau during this period, or may be a result of later disturbance to the area destroying evidence from this time. Nearby projects have found sparse Latte Period material, and historical records indicated traditional villages were located in the vicinity of the project area at the end of the 17th century, so material from this time may be expected in the project area. Given the overall scarcity of material from this time in this area, any sites dating to this time would be of great importance in interpreting the use of the area.

2. **What was the nature of the 20th-century use of the project area, if any?**

   Previous projects in the vicinity of the project area have identified features related to Post-WWII ranching. Such features may also be present in the project area and could aid in interpreting how this area was used during the 20-century, both before and after WWII.

EXPECTATIONS

It was expected that Latte Period cultural material may be present in limited quantities in the project area. Although material from this period is generally sparse in this area, such material has been found previously at several locations within 0.25 miles (400 m) of the project area. Historical records indicate several traditional villages were located in this general area at the end of the 17th century. Material at other sites consisted of small surface scatters of Latte Period ceramics, sometimes mixed with later historic ceramics (Moore et al. 1986; Kurashina et al. 1987). It was expected that any surface material in the project area would be similar. Subsurface deposits, although unlikely to be extensive due to the shallow depth of the soil, could be associated with any surface scatters. The review of the historical land use of the project area did not suggest any significant cultural material from later periods should be expected, as the area appears to have remained vacant until the construction of Simon Sanchez High School. However, given the findings of post-WWII ranching features nearby (Workman and Haun 1993, 1995), such features could be present in the project area as well. Due to the clearing and leveling of most of the area associated with the construction of the high school, the highest probability for cultural resources was in the vegetated area at the southern edge of the project area, which was presumed to be less disturbed.

SURVEY AND SUBSURFACE TESTING METHODS

The entirety of the 27.75 ac. area designated for archaeological survey was subject to pedestrian survey and subsurface testing, with a focus on the vegetated area at the southern end of the project area.

A team of two archaeologists conducted pedestrian survey of the project area. Vegetation clearance was be kept to the minimum required to fully document any sites. The following pedestrian survey methods were used:

1. Survey transects were spaced 5–10 m apart; tighter spacing was be employed in areas of dense vegetation.

2. The archaeologists kept an updated daily log that recorded work completed (including the number of transects), notes on any finds, and summaries of other relevant information (e.g., the density of vegetation, evidence for modern disturbance). The daily log was completed using a standardized form on Samsung Galaxy tablet computers.

3. Photographs were taken of all archaeological finds and overviews of the survey area. Photographs were taken using a Samsung Galaxy Tab S3 (SM-T820) tablet with a 13.0-megapixel camera and included a scale and north arrow (with the exception of landscape overview photographs) and were recorded in a photography log. The log includes the photograph file number, the date that the photograph was taken, the direction the photographer was facing, a general description of the photograph, and the initials of the photographer.

4. The locations of archaeological sites and features were recorded with a professional-grade Trimble GeoXH Global Positioning System (GPS) unit using World Geodetic System (WGS) 84 Universal Transverse Mercator (UTM) Zone 55 North. GPS data was differentially corrected for submeter accuracy and was exported as a geographic information system (GIS) geodatabase. The location of isolated surface artifacts or low-density clusters of artifacts (e.g., sherds), had they been found, would be recorded similarly. In the case of a low-density cluster of pottery or lithics, the remains would be defined by only a center GPS point in some cases, or with a polygon that shows the dispersal area in other cases. GPS data was differentially corrected for submeter accuracy and exported as geographical information system (GIS) shapefiles. These data were plotted on a U.S. Geological Survey (USGS) topographic quadrangle map using ArcMap. In regard to shovel testing at the location of an isolated find (or low-density cluster), a decision about testing was made following completion of the surface survey of the project area; this involved a consideration of such factors as the degree of past disturbance of soil at the location, the overall goals of the project, and time constraints versus other project requirements. In most cases, a shovel test would not be conducted at the location of an isolated surface find.

5. In terms of isolated surface finds, if the item was chronologically or functionally diagnostic or unique (e.g., a stone adze), it would be collected (following GPS recording) for laboratory analyses and documentation. This would include all isolated portable artifacts (lithic, bone, and shell artifacts, and decorated pottery or

rim sherds). Plain body sherds would have been described in the field and left in place.

6. Archaeological sites and features would be documented through text descriptions, plan view maps, and photography (with a north arrow and scale), along with GPS recording. Text descriptions would be completed on the tablet computers using a standardized form, which includes fields to record site/feature form and construction details, metric dimensions, age and function assessments, integrity and condition evaluations, associated surface artifacts, and environmental characteristics (slope, substrate/soil, vegetation).

Following the pedestrian survey, a team of two archaeologists conducted subsurface testing of the area. Shovel test pits (STPs) were focused primarily in the vegetated area as this is the most likely area to contain intact subsurface deposits. A total of 46 STPs were excavated, 8 of which were placed across the northern grassy area while 38 were distributed across the southern vegetated area. Thirteen of the STPs (03, 05, 06 [both 2022 and 2023], 07, 09, 10, 11, 14, 35, 36, 41, and 42) originally plotted prior to fieldwork could not be excavated as they were placed within the grid in areas that had either shallow turf with pavement/compact gravel underneath (open grassy areas to the north) or on an immovable push pile of debris (vegetated areas to the south). The STPs are numbered 1–46 (see Figure 16). Note, however, that 13 of these are duplicate numbers (STPs 01-13) which were excavated in March 2023. These are highlighted in Figure 16 and Table 4 (STP summary) for easy reference. The following subsurface testing methods were used:

1. STPs were 50 by 50 cm squares excavated to culturally sterile sediment or bedrock. STPs were excavated by natural strata in approximately 10–20 cm levels.

Excavated soil was not screened but was visually inspected and combed through for cultural material. If artifacts or midden had been observed, a measured bulk sample of the deposit (approximately 1 to 5 liters) would have been collected and passed through a 1/4-inch screen. Cultural material retained in the screen would have been collected for quantification and characterization at IA's Guam laboratory.

2. All STPs were photographed at the completion of excavation with a north arrow and scale visible in the image. Stratigraphic profiles were drawn for representative STPs, as well as for STPs that revealed an archaeological deposit or feature. The profiles are accompanied by detailed soil descriptions following the U.S. Department of Agriculture (USDA) Soil Survey Manual and Munsell color. The profiles were drawn in metric units, the cardinal direction of the profiled sidewall face was noted, and the location was recorded with a professional-grade Trimble Geo XH GPS unit using WGS 84 UTM Zone 55 North. GPS data was differentially corrected for submeter accuracy and exported as geographical information system (GIS) shapefiles.

3. If subsurface archaeological features were exposed, they would be drawn to scale and photographed in profile or plan view, whichever was appropriate. The stratum from which the feature originated would be recorded as would metric and non-metric characteristics. Feature matrix would be excavated separately from the surrounding stratum. A bulk soil sample would be collected from all cultural deposits and subsurface features. Bulk samples would be screened with 1/8 in. mesh and cultural contents will be collected for laboratory analyses. For

combustion features, charcoal samples would be collected for possible wood charcoal identification and radiocarbon dating.

4. Artifacts, midden, and charcoal recovered from the STPs would be collected in sealable bags that have a unique catalog number and which record the contents, provenience (STP/probe number, layer and level, and depth below surface), collection date, and recorder.

5. If significant archaeological deposits were discovered, GHRD would be consulted to determine the appropriate level of analysis, including radiocarbon dating or other specialized studies.

6. If human skeletal remains were encountered, work would cease at the find location, the remains would be secured in place, and GHRD would be notified of the find. Skeletal remains would be handled with respect and dignity. The rules and regulations enumerated in the following documents would be followed: Guam Public Law 20-151; Guam Code Title 21, Division 2, Chapter 76; Guam Executive Order 89-24; and the Department of Recreation General Guidelines for Archaeological Burials as amended March 2010. IA would ensure that the remains were secure and await direction from the government.

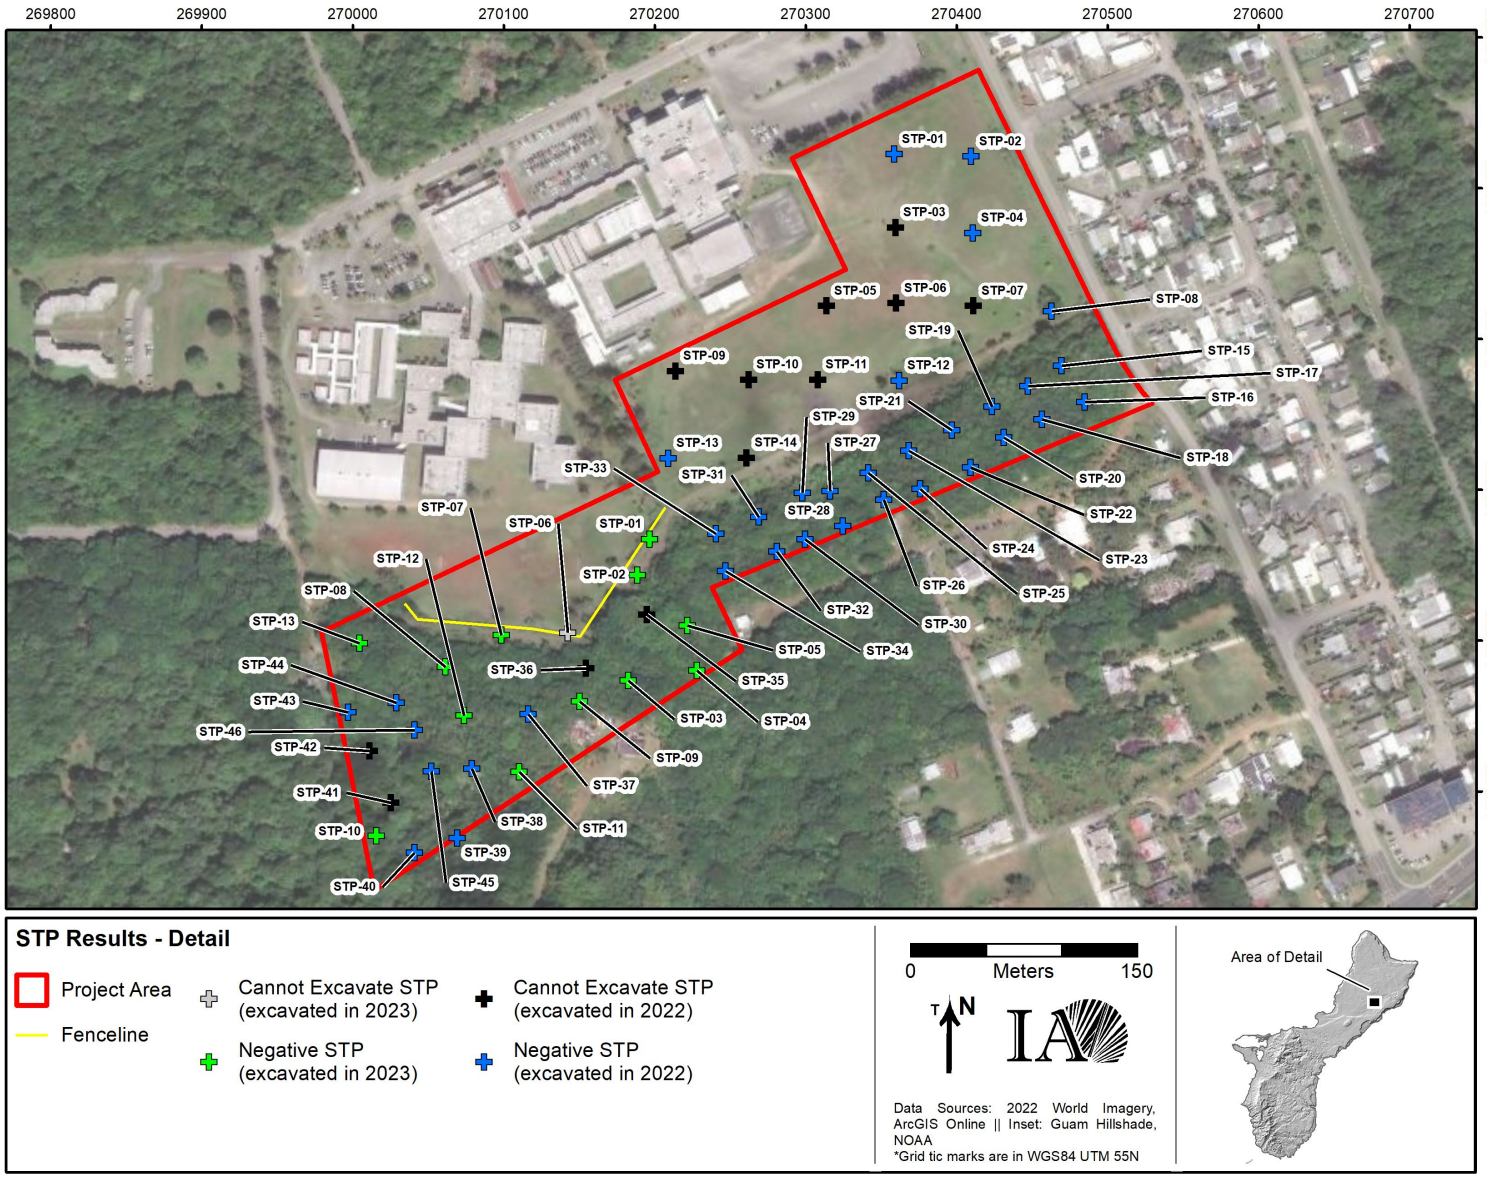

Figure 16. STP locations.

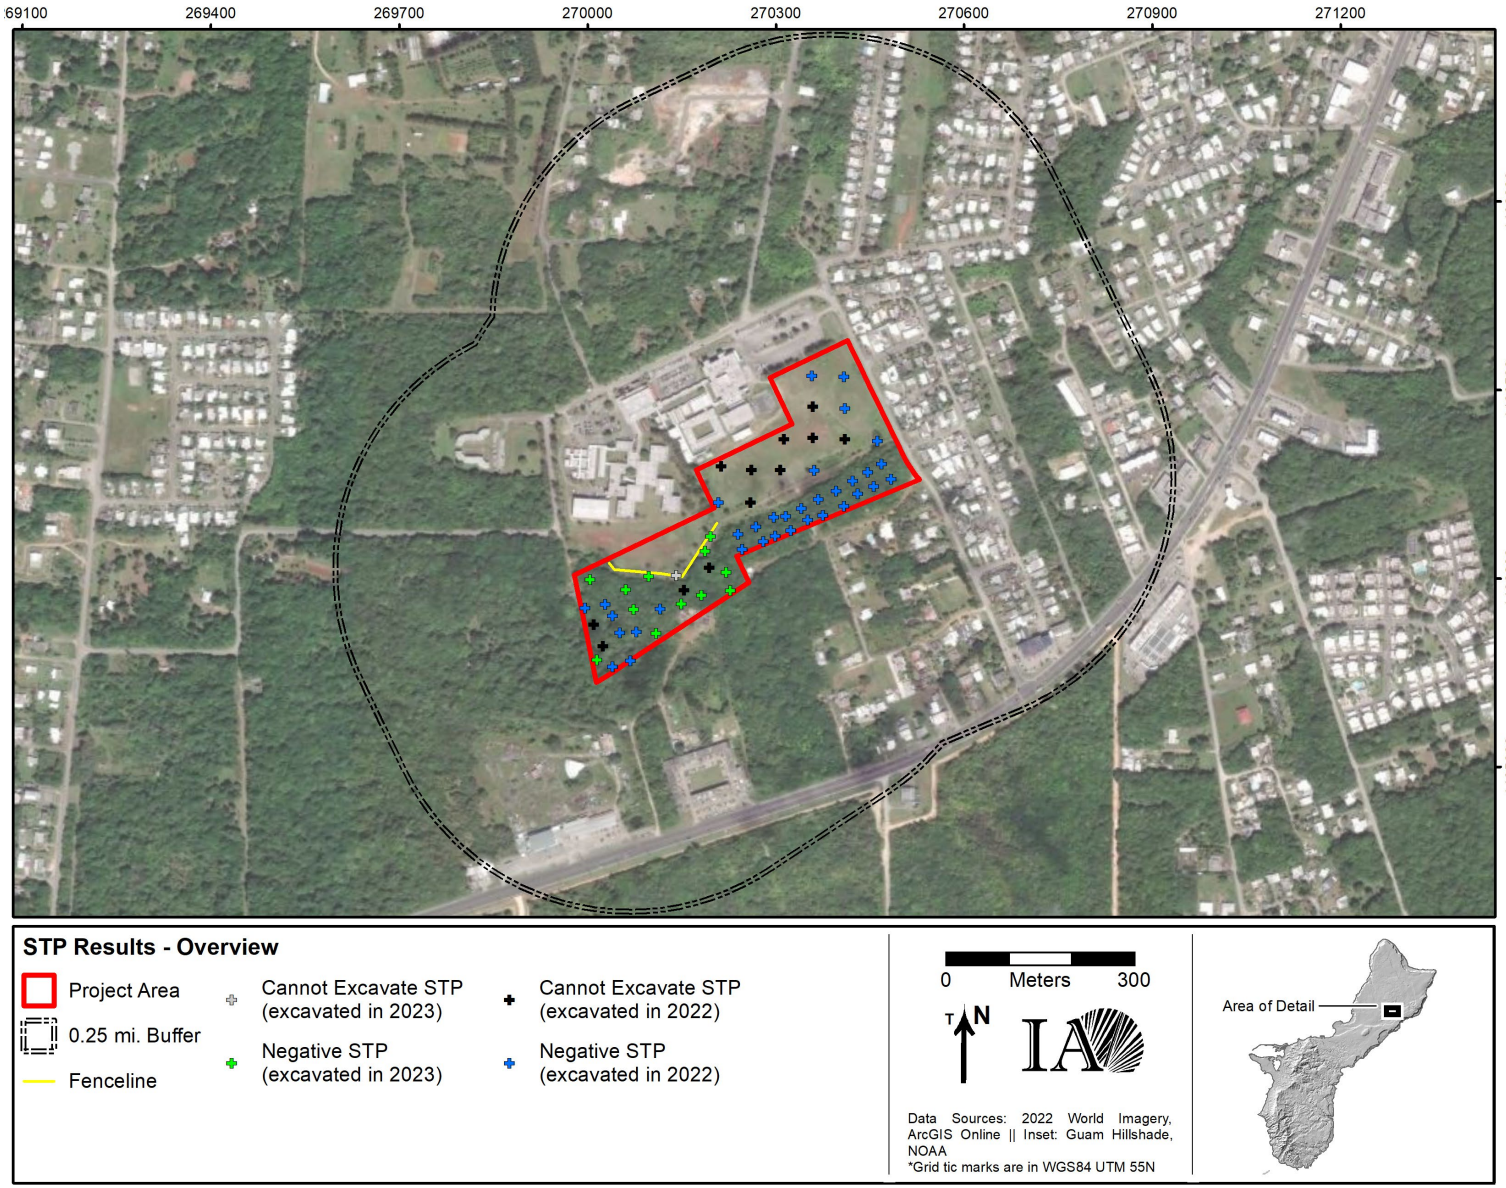

Figure 17. STP locations showing 0.25 mile buffer zone.

POST-FIELDWORK ANALYSES

Field collections, if any were found, would be cleaned and sorted at IA's Guam laboratory. Artifacts would be sorted by material and type. Metric and non-metric attributes would be recorded for all diagnostic pottery sherds, as well as lithic, shell, and bone artifacts. Vertebrate and invertebrate faunal remains would be sorted to the lowest taxonomic category possible with identifications aided by IA's reference collections and published reference guides. Laboratory results would be presented in prose, tabular, and chart formats in the report.

If significant archaeological deposits with appropriate materials were discovered, specialized analyses agreed to in consultation with GHRD could include, but not be limited to taxonomic identification of charcoal samples, radiocarbon dating, residue or plant microfossil analysis of ceramic and lithics, and petrographic or geochemical analysis of ceramics and lithics.

All materials other than human skeletal remains would be processed and stored in the IA's archaeology laboratory for transfer to the Guam Repository on completion of the project. Standard archival boxes are used for storage, and each box would be accessioned and labeled. Field notes and forms would also electronically stored at the International Archaeology Research Institute Inc. office for transfer to the Guam Repository. Human skeletal remains also, if discovered, would be transferred to Guam Repository upon completion of the project. Laboratory data would be recorded on standard laboratory forms and input into a database. All analytic results would be presented in coherent tabular format in the report and discussed in the text.

IV. RESULTS AND DISCUSSION

This section presents the results of the survey and subsurface testing. No archaeological resources were identified. All STPs were negative for archaeological deposits and material (Figure 16) and all observed sediment was either imported fill or archaeologically sterile natural soil.

The project area included both open areas on the school grounds to the north and a heavily vegetated area to the south. The open areas were flat and covered in short grass with no observable cultural material on the surface during pedestrian survey. The heavily vegetated areas were within an urban residential area with modern refuse ubiquitous throughout, including abandoned structures and vehicles, large appliances, tires, metal debris, and trash. Previous clearing efforts have resulted in large push piles that generally run from east to west.

Forty-four STPs were required as part of the work plan, though 46 were excavated. As noted previously, 59 total STP locations were plotted across the project area, but excavation was not possible in 13 of these because of underlying pavement/fill or proximal refuse push piles. In addition, 13 of the STPs had duplicate numbers resulting from the first phase of the project taking place in February 2022 and the second phase taking place more than a year later, the latter starting the numbering sequence over again (see Figure 16 and Table 4). Subsurface testing was complicated by the highly disturbed nature of the area and the difficulty of manually excavating through compact fill or gravel which was pervasive across much of the open northeast portion of the project area, and various parts of the more heavily vegetated southwest portion of the project area due to debris push piles and/or concentrated refuse (see Photo 1–Photo 56 and Figure 17–Figure 25 for representations of STP excavations and recorded stratigraphy).

SOILS AND STRATIGRAPHY

Two soil strata (Layers I and II) were identified across the project area. Layer I was a mixed humic (A horizon) developing on top of a weakly developed B horizon and/or fill depending on the location. Layer II was a mix of A and B horizons mixed with fill and/or refuse.

Layer I was a silty clay loam that extended between 0–42 cm bs, though this layer was mostly relegated to the top 20 cm bs in most areas. Layer II was only found intermittently in four of the STPS. Thirteen of the planned STPS could not be excavated due to either pavement or hard compact fill found underneath the turf in the open grassy areas or the presence of push piles and heavy root concentration in the vegetated areas in the southern part of the project area.

The primary purpose of the survey was to determine the presence or absence of cultural resources in the project area, in particular whether there was evidence of late pre-Contact or early post-Contact resources, as remains from other time periods were not expected. The following research questions were posed in the research design:

What was the nature of the late pre-Contact and early post-Contact use of the project area, if any?

No archaeological deposits were encountered during subsurface testing. No cultural material was recovered. The potential for previously undocumented archaeological deposits in this area is unlikely as excavation revealed a shallow, mixed A horizon in all STPs that in some cases overlaid pavement or filling with modern construction fill overlaying a poorly developed B horizon intermixed with fill and/or refuse.

What was the nature of the 20th-century use of the project area, if any?

As noted above, previous projects in the vicinity of the project area identified features related to Post-WWII ranching. Such features could have also been present in the project area and could aid in interpreting how this area was used during the 20th-century, both before and after WWII. However, there was no cultural material related to any WWII or post-WWII activities.

V. CONCLUSION AND RECOMMENDATIONS

At the request of Taniguchi Ruth Makio Architects +, Guam, International Archaeology, LLC conducted archaeological survey and subsurface testing in support of the proposed expansion of Simon Sanchez High School, Yigo, Guam (Figure 2 and Figure 3). The proposed project encompasses the construction of several new buildings, renovating several existing buildings, and upgrading the associated parking lots and utilities. Archaeological pedestrian survey and subsurface testing covered an area of approximately 27.75 ac., including the undeveloped portions of the Simon Sanchez High school property, as well as part of the adjoining F.B. Leon Guerrero Middle School property.

Because the area had a known history of late pre-Contact or early post-Contact resources, it was expected that there could be evidence for these, while evidence would be lacking for earlier periods. However, no archaeological deposits and no cultural resources were encountered during survey and subsurface testing of the project area, which included 46 STPs. Given the area's long history of disturbance during and after WWII, particularly during construction of the Simon Sanchez High School and related buildings that included grading and filling of the fields, and also the use of the highly vegetated area in the southern portion of the project area as an illicit dumping area in more recent years, it is unlikely that archaeological deposits, if present, are still intact. Given these findings, additional archaeological testing is not recommended for the project area. Also, archaeological monitoring during construction would seem to be of little value and is not recommended.

31 August 2022

327.110

INTRODUCTION

This report presents the results of the subsurface soil investigation we conducted for the New Simon Sanchez High School, planned for construction in Yigo, Guam.

We understand that the existing school buildings will be demolished and to be replaced with new school facility. The planned development will consist of an administration building, credit recovery building, classrooms (A-, B-, and C-wings), gymnasium, auditorium, an open field, and a multi-purpose field. Site improvements will include parking lots and storm water surface run-off disposal.

The purpose of our investigation was to perform limited explorations of the subsurface soil conditions at the project site, perform limited laboratory testing and engineering analyses and evaluation to provide discussion and recommendations concerning the site grading earthwork and foundation supports of the new structures generally as follows:

1. General subsurface conditions of the project site (based on the test boring information obtained at the site).

2. Site grading earthwork, soil material requirements, placement and compaction procedure, and subgrade improvements, as appropriate.

3. Foundation support methods for the new buildings, and settlement estimate.

4. Subgrade preparations for the on-grade concrete ground floor slabs, pavements.

5. New flexible asphalt pavement section design thicknesses.

6. Percolation rate for storm water runoff disposal design.

We conducted the test borings on March 16 to 22, 2022 and again on June 20 to 30, 2022. We provided the General Assessment and Preliminary Geotechnical Recommendations Report to TRM+A on June 15, 2022.

SUBSURFACE EXPLORATIONS

Test Borings

A total of 40 test borings were drilled at the project site. We initially drilled a total of 20 test borings; however, there were modifications on some structures as well as boring locations. After the modifications and new boring locations were completed, we resumed and drilled the additional 20 test borings. The test borings were drilled utilizing a truck-mounted, 8-inch diameter hollow-stem auger drill rig to approximately 17 to 30 feet below the existing ground surface or in hard coralline limestone below. The locations of the test borings are shown on Plate 1.

During the subsurface explorations, our technical staff was at the site full-time logging the subsurface materials that were encountered in the test bored holes and obtaining disturbed and undisturbed subsurface soil and rock samples for visual examination, soil and rock classifications, and laboratory testing. The logs of the test borings are presented on Plates 2 through 41. The Soil Classification System that has been used for describing and classifying soils is presented on Plate 42.

While obtaining the subsurface soil and rock samples, we also obtained the standard penetration test (SPT) values or N-values. The N-value is defined as the number of blows per each foot of penetration into the underlying, undisturbed soil or weak to moderately hard rock, utilizing a 2.0-inch outside diameter, split spoon soil sampler, driven by a 140-pound drop weight free falling 30 inches per each blow.

However, in order to obtain better undisturbed soil samples for laboratory testing, a larger, 3.0-inch outside diameter split spoon soil sampler was used and the field blow counts were converted to the standard penetration test or N-values using a correction factor of 0.68 times the field blow counts of the 3.0-inch diameter sampler.

The N-values obtained from the test bored holes are shown on the logs of the test borings where they were taken.

Percolation Tests

In addition to conducting the test borings, we also performed four percolation tests at the locations also shown on Plate 1. The percolation test holes were excavated to approximately 13 to 24 inches in diameter and 3 feet deep below the existing ground surface.

Percolation Tests 1, 2, and 3 exposed few inches of reddish brown-white gravelly sandy silt, overlying light brown-white coralline limestone formation. Percolation Test 4 encountered approximately 7 inches thick of reddish brown-white gravelly sandy silt, followed by reddish brown clayey silt to the bottom of the test hole.

The percolation test holes were saturated first prior to conducting the tests. The following percolation test results were obtained together with our recommended rates:

Percolation Test No	Average rate, inches/minute	Last rate, inches/minute	Recommended rate, inches/minute
1	0.108	0.041	0.041
2	0.057	0.048	0.028
3	0.284	0.109	0.109
4	0.149	0.084	0.074

Note: 1. Percolation rates may vary from point to point.
2. The recommended rate is either the last rate or the average rate, Whichever is lower.

LABORATORY TESTING

In our laboratory, the subsurface soil and rock samples obtained from the project site were re-examined and selected soil/rock samples were tested to determine their in-situ moisture content, unit weight (dry density), particle size distribution, liquid limit and plasticity index, and minus no.200 sieve (silt and clay particles). The results of the tests are shown on the boring logs where the tested samples were taken, and are also shown graphically on Plates 43 through 55. A Key to Test Data shown on Plate 42 explains the abbreviations of the test designations shown on the logs of the test borings.

The laboratory tests performed for this project were in accordance with the American Society of Testing and Materials (ASTM) standard test procedures.

SUBSURFACE CONDITIONS

In general, the project site is underlain with variable thickness of overburden soil consisting of few inches to approximately 5 feet thick of loose to very dense silty sandy limestone gravel and gravelly silty sand, and soft to very stiff clayey silt, sandy silt, gravelly silt, and gravelly clayey silt, overlying native coralline limestone formation; the limestone should extend to much deeper, likely more than a few hundred deep below surface. The coralline limestone is mostly hard with weak and moderately hard zones.

No ground water was found in the test borings. Permanent ground water at the project site should be deeper than a few hundred feet below surface or close to the sea level. Therefore, ground water has no significance to this project.

Seismic Site Class – The shallow depth native coralline limestone formation should extend to much deeper than 100 feet below the existing surface, which is the depth of defining seismic site class; therefore, the seismic site class of the project site is Class C in accordance with the 2012 International Building Code, which is defined as very dense soil and/or soft rock.

DISCUSSION AND CONCLUSIONS

Based on the results of our investigation, the project site is underlain with shallow overburden soil overlying mostly hard coralline limestone. The new buildings can be supported on conventional, shallow spread footings and/or

continuous footings, resting on moderately hard to hard coralline limestone or on densely compacted, silty limestone sand/gravel soil having at least 95 percent of its maximum dry density (MDD, as determined from ASTM D1557 laboratory compaction test).

Details of our recommendations are presented in the remainder of this report.

RECOMMENDATIONS

Site Clearing and Stripping – Initially, the areas to be graded should be cleared of vegetation, debris and unsuitable matters. Topsoil containing roots should be stripped and disposed elsewhere or stockpiled at appropriate locations for later reuse in landscaping, if it is desired.

Additional Excavation – After the above and any site cuts are completed, within the new structural footprints, including sidewalks, walkways, and parking areas, and at least 3 feet wider all around their edges, any exposed silty soil, which is potentially expansive that can shrink or swell with its moisture change, should be excavated entirely or 3 feet deep maximum, subject to the approval of the geotechnical engineer during construction, for replacement with densely compacted, non-expansive, limestone silty sand/gravel soil fill.

Recompaction – After the required excavations are completed, the final exposed surfaces of the excavated areas and the areas to be filled should be lightly scarified to approximately 6 inches deep, moisture conditioned (wetted or

air dried) as necessary, and recompacted to achieve at least 95 percent of its MDD, with uniform, dense and unyielding surfaces.

Fill and Backfill Soils and Placement – All fill and backfill soils should be free of organic matter, debris, and rock fragments or lumps larger than 4 inches or one-half of the compacted layer thickness, whichever is less, in greatest dimension. In addition, the fill and backfill soils within the building footprint and exterior concrete slabs and sidewalks, driveways and parking lots, including at least 3 more feet wider all around their edges, should be non-expansive with plasticity index 12 percent maximum, liquid limit no more than 35 percent, and contain no more than 30 percent finer than no. 200 mesh sieve (silt and clay sizes), but should have adequate medium to coarse sand for dense compaction.

Approved fill and backfill soils should be placed in 10-inch maximum loose layers, moisture conditioned as necessary and compacted to at least 95 percent MDD of the soil being compacted.

The on-site excavated, silty limestone sand/gravel soils meeting the above requirements may be re-used as fill and backfill soils.

The on-site excavated silty soil should only be used in non-load-bearing areas, and utility backfill outside of the load-bearing areas. The compacted density of such backfill can be 90 percent of its MDD, or 85 percent MDD in landscape areas.

Potential Hard Rock Excavation - In general, the on-site coralline limestone rock is mostly hard and will be difficult to excavate, and will require an excavator with vibratory rock breaker. The contractor should be responsible for

the excavations and the safety of men and equipment working with and around the excavations.

Foundation Supports

The new buildings can be supported on shallow spread footings and/or continuous footings resting directly in the underlying, moderately hard to hard coralline limestone formation or densely compacted, silty limestone sand/gravel soil fill or subbase fill compacted to at least 95 percent of its maximum dry density (MDD).

The foundations should be designed with the following criteria:

1. Allowable bearing pressures:
   Dead plus live loads
   (psf = pounds per square foot) — 4000 psf

   Total design loads, including
   wind or seismic forces — 5300 psf

2. Resistance to lateral loads.

   Friction across foundation bottoms
   (percent of dead load at foundation
   bottoms) — 35

   Passive soil resistance against one face
   of the footings (triangular with depth) for
   densely compacted sand/gravel soils
   around the footings. Ignore top one foot
   if it is not directly covered with concrete
   slab or asphalt pavement), — 400 pcf
   (pcf = psf/ft. of depth or pounds per cubic foot)

3. Minimum footing width, columns — 3 feet
   walls — 2 feet

4. Minimum footing embedment below lowest
   adjacent final grade, columns — 3 feet
   walls — 2 feet

During construction, if silt or loose sand/gravel are found at the footing bottom (footing subgrade), they should be removed entirely and replaced with densely compacted, silty limestone sand/gravel soil fill in 8-inch maximum loose loose layers, moisture conditioned as necessary and compacted to at least 95 percent of its MDD, including edges and corners.

The footings strictly constructed as recommended herein should be designed to tolerate 1-inch total settlement and 1-inch differential settlement across the building width.

Subgrade Preparation for Concrete On-Grade Slabs

The finished subgrades for the on-grade concrete slabs should have been compacted to a uniform, dense and unyielding surface with at least 95 percent of its MDD, or relatively clean, exposed moderately hard to hard limestone. The concrete slabs should be directly underlain with 6 inches thick of crushed aggregate base course meeting standard road paving base course requirements, uniformly spread without segregation, moisture conditioned as necessary and compact to dense and unyielding with 100 percent of its MDD.

Where penetration of moisture vapor through the concrete on-grade slabs is objectionable, an impervious membrane should be placed between the compacted aggregate base course and the concrete slabs.

Flexible Pavements

The following flexible asphalt pavement sections should be used for the new access roads, driveways, and parking areas for passenger vehicles, light and heavy trucks:

	Asphalt Surface	Aggregate Base
Main access road and heavy truck trafficking and parking areas	3 inches	8 inches
Passenger vehicles and light pick-up truck traffic and parking areas	2 inches	6 inches

The pavement subgrades should be either moderately hard to hard coralline limestone or densely compacted, non-expansive silty limestone sand/gravel soil with at least 95 percent of its MDD, as recommended earlier in this report. The final subgrade surfaces should be inspected and verified by the special inspector or the geotechnical engineer of the project

The base course aggregate should conform to the following requirements:

Sieve Size	Cumulative Percent Finer by Weight
2 inches	100
1.5 inches	90 - 100
0.75 inch	50 - 80
No. 4	30 - 60
No. 40	15 - 30
No. 200	5 - 13

Fraction passing No. 200 sieve should not be more than 1/2 of fraction passing No. 40 sieve.

California Bearing Ratio	100 minimum
Abrasion wear	40 maximum
Liquid limit	25 maximum
Plasticity index	6 maximum

The base course aggregate should be uniformly spread without segregation, uniformly moisture conditioned as necessary and compacted with a vibratory roller compactor at least 10 tons in weight to provide a uniform, dense and unyielding surface with 100 percent of its MDD. Care should be taken during the spreading of the base aggregate to avoid segregation of the aggregate.

Construction Inspection and Testing

During construction, the earthwork and foundation construction, including the flexible asphalt pavement, should be performed under geotechnical engineering inspection and testing to verify that the works and the materials used conform to the project plans and specifications and the intent of the geotechnical recommendations, and to modify the recommendations if unanticipated subsurface conditions are found. Inspection and testing would satisfy the requirements of the 2012 International Building Code.

INVESTIGATION LIMITATIONS

Our findings, discussion and recommendations presented herein are based on the information obtained from the test borings of this investigation. Unanticipated subsurface conditions may be encountered during construction and cannot be fully determined by test borings. Therefore, some contingency fund is thus recommended for the project to accommodate these possible costs.

This report has been prepared for the exclusive use of the government and the project architects and engineers, and the project contractor. It shall not be used by or transferred to any other party or to another project without the prior written, expressed consent and/or thorough review by this facility.

The following plates are included to complete this subsurface soil investigation report for the New Simon Sanchez High School, planned for construction in Yigo, Guam.

			GC		CLAYEY GRAVELS, POORLY GRADED GRAVEL - SAND - CLAY MIXTURES
	SANDS (MORE THAN HALF COARSE FRACTION IS SMALLER THAN No. 4 SIEVE SIZE)	CLEAN SANDS WITH LITTLE OR NO FINES	SW		WELL GRADED SANDS, GRAVELLY SANDS
			SP		POORLY GRADED SANDS, GRAVELLY SANDS
		SANDS WITH OVER 12 % FINES	SM		SILTY SANDS, POORLY GRADED SAND - SILT MIXTURES
			SC		CLAYEY SANDS, POORLY GRADED SAND - CLAY MIXTURES
FINE GRAINED SOILS (MORE THAN HALF IS SMALLER THAN # 200 SIEVE)	SILTS AND CLAYS (LIQUID LIMIT LESS THAN 50)		ML		INORGANIC SILTS AND VERY FINE SANDS, ROCK FLOUR, SILTY OR CLAYEY FINE SANDS, OR CLAYEY SILT WITH SLIGHTLY PLASTICITY
			CL		INORGANIC CLAYS OF LOW TO MEDIUM PLASTICITY, GRAVELLY CLAYS, SANDY CLAYS, SILTY CLAYS, LEAN CLAYS
			OL		ORGANIC CLAYS AND ORGANIC SILTY CLAYS OF LOW PLASTICITY
	SILTS AND CLAYS (LIQUID LIMIT GREATER THAN 50)		MH		INORGANIC SILTS, MICACEOUS OR DIATOMACEOUS FINE SANDY OR SILTY SOILS, ELASTIC SILTS
			CH		INORGANIC CLAYS OF HIGH PLASTICITY, FAT CLAYS
			OH		ORGANIC CLAYS OF MEDIUM TO HIGH PLASTICITY, ORGANIC SILTS
HIGHLY ORGANIC SOILS			Pt		PEAT AND OTHER HIGHLY ORGANIC SOILS

SOIL CLASSIFICATION SYSTEM AND KEY TO TEST DATA

SA	=	Sieve Analysis
LL	=	Liquid Limit
PI	=	Plasticity Index

SPECIAL NOTE :

1. PURSUANT TO PL 28-126, SECTION 1(d), THIS IS A LOT PARCELING SURVEY MAP, AND THEREFORE EXEMPTED FROM THE MAP PROCESSING REQUIREMENTS OF PL 28-126, SECTION 1(a).
2. THE DIFFERENCE OF AREA BETWEEN COMPUTED AND RECORD ARE BASED ON FOUND CORNERS AND FIELD CONDITION.

LEGEND :

- GGN STATION
- FND. No. 4 REBAR WITH A BROKEN CAP, SET BY UNKNOWN, REPLACED WITH 0.102m x 0.102m x 0.457 CONC. MON. CENTERED WITH 0.064M DIA. BRONZE DISK MARKED GWA BOUNDARY / P.L.S. No. 65
- FND. No. 4 REBAR WITH CAP MARKED DLM - ONE FOOT DEEP, PLACED A 0.102m x 0.102m x 0.457 CONC. MON. MARKED PLS 65 ON TOP OF REBAR (SAME LOCATION)
- SET 0.102m x 0.102m x 0.457 CONC. MON. CENTERED WITH 0.064M DIA. BRONZE DISK MARKED GWA BOUNDARY / P.L.S. No. 65
- SET 0.102 x 0.102 CONC. MONUMENT WITH PLASTIC CAP MARKED PLS 65
- FOUND NO. 4 REBAR WITH PLASTIC CAP MARKED RLS 48, UNRECORDED
- FOUND 3/4 DIA. G.I. PIPE WITH BRASS TAG MARKED RLS No. 24, REF #5
- FOUND NO. 4 REBAR WITH PLASTIC CAP MARKED RLS 77, UNRECORDED
- SET No. 4 REBAR WITH PASTIC CAP MARKED PLS No. 65
- CONCRETE POWER POLE
- GUY WIRE
- TELEPHONE PEDESTAL
- FIRE HYDRANT
- SIGN POST
- WV WATER VALVE
- LAMP POST

AUTHORITY (GDOE) :

REFERENCE: PROFESSIONAL LAND SURVEYING SERVICES
FORMAT REQUEST FOR PROPOSAL: GDOE RFP 005-2019
PURCHASE ORDER No. 20191056

AUTHORITY (GWA) :

1. LAND SURVEY AGREEMENT BETWEEN GUAM WATERWORKS AUTHORITY AND DUENAS CAMACHO & ASSOCIATES Inc.; RFP GWA-2007-04. DATED NOVEMBER 19, 2007.
2. GRANT DEED Doc. No. 567559
   GRANTORS: GOVERNMENT OF GUAM AND / OR FORMER PUBLIC UTILITY AGENCY OF GUAM (PUAG)
   GRANTEE: GUAM WATERWORKS AUTHORITY (GWA)

GRANTORS HEREBY GRANT, TRANSFER, ASSIGN, AND CONVEY TO THE GRANTEE IN FEE SIMPLE ABSOLUTE, THE REAL PROPERTY INTERESTS FOR ONLY THOSE PORTIONS OF LANDS REQUIRED BY THE GRANTEE FOR PUBLIC UTILITIES PURPOSES.

SATISFACTORY TO AND APPROVED BY :

JON LUB FERNANDEZ, SUPERINTENDENT OF EDUCATION, GOVERNMENT OF GUAM — 2-17-20 DATE

MIGUEL C. BORDALLO, P.E., GENERAL MANAGER, GUAM WATERWORKS AUTHORITY, GOVERNMENT OF GUAM, FOR GWA DEEP WELL SITES Y-05 AND Y-06 — 11-21-19 DATE

JOSEPH M. BORJA, DIRECTOR, DEPARTMENT OF LAND MANAGEMENT, AUTHORIZED PURSUANT TO GRANT DEED Doc. No. 567559, PAGE 29, THEREOF, FOR GWA DEEP WELL SITES Y-05 AND Y-06 — 10/25/20 DATE

LOURDES A. LEON GUERRERO, GOVERNOR OF GUAM, APPROVAL PURSUANT TO GRANT DEED Doc. No. 567559, PAGE 29, THEREOF, FOR GWA DEEP WELL SITES Y-05 AND Y-06 — 11/07/2020 DATE

NOTES :

1. SURVEY WAS BASED ON FOUND CORNERS AS SHOWN.
2. ALL DISTANCES ARE IN METERS UNLESS OTHERWISE NOTED.
3. BEARINGS AND DISTANCES WITHIN THE PARENTHESES ARE RECORD DATA, WITHIN BRACKETS ARE BASED ON REF. No. 2, ALL OTHERS ARE 1993 GRID.
4. SUBJECT LOT IS WITHIN THE NORTHERN WATER RECHARGE AREA.
5. SUBJECT LOT IS ZONED "A" AGRICULTURAL PER 1967 OFFICIAL ZONING MAP F387S41.
6. EXISTING AS-BUILTS SHOWN AS OF APPROVAL OF THIS MAP.
7. VERTICAL CONTROL SURVEY WAS BASED FROM GGN 0643 WITH AN ELEVATION OF 436.68 FEET MEAN SEA LEVEL (MSL) DATUM. CONTOURS WERE DEVELOPED FROM SPOT ELEVATIONS USING A COMBINATION OF GPS AND CONVENTIONAL TOPOGRAPHIC GROUND METHOD.

Drawing No. T-5

Sheet No. of

1 DEMOLITION PLAN
SCALE: 1" = 80'-0"

NORTH
SCALE 1:80 0' 40' 80' 160'

IF SHEET IS LESS THAN 24" X 36" REDUCED PRINT – USE GRAPHIC SCALES

HABITAT CONSERVATION MEASURES:

1. CONSERVATION MEASURES MUST BE DONE PRIOR TO ALL DEMOLITION AND CONSTRUCTION WORK.
2. CONDUCT A BIOLISIGCAL SURVEY TO IDENTIFY ANY GUAM TREE SNAILS BEYOND THE EXISTING HABITAT BOUNDARY IDENTIFIED IN THE DRAWINGS.
3. PROVIDE A CONTINUOUS PROTECTIVE CONSTRUCTION MESH BARRICADE ALONG THE EXISTING SNAIL HABITAT BUFFER PERIMETER. ADJUST THE PERIMETER AFTER SNAILS ARE RECOLATED FROM THE SPECIFIED AREA OF THE EXISTING COLONY TO THE NEW HABITAT AREA.
4. PROVIDE A PERMANENT CHAIN LINK SECURITY FENCE WITH PERSONNEL ACCESS GATES AT THE PERIMETER OF THE MODIFIED EXISTING SNAIL HABITAT AND THE NEW HABITAT AREA.

DEMOLITION KEYNOTES:

1 EXISTING PARKING LOT TO BE DEMOLISHED.
2 EXISTING BUILDINGS TO BE DEMOLISHED.
3 EXISTING FENCE TO BE DEMOLISHED.

DEMOLITION NOTES:

1. EXISTING SCHOOL FACILITIES TO REMAIN IN USE DURING PHASE 1 WORK EXCEPT WHERE OTHERWISE NOTED. MAJOR DEMOLITION WORK COMMENCES WITH PHASE 2 WORK.
2. VERIFY EXISTING CONDITIONS & DIMENSIONS.
3. ALL WORK SHALL BE IN COMPLIANCE WITH APPLICABLE FEDERAL AND LOCAL CODES AND REGULATIONS PERTAINING TO LIFE SAFETY, PROPERTY PROTECTION, AND ENVIRONMENTAL PROTECTION.
4. PROVIDE AND MAINTAIN HOARDING/BARRICADES, LIGHTING, AND GUARDRAILS AS REQUIRED BY APPICABLE CODES AND REGULATIONS TO PROTECT OCCUPANTS OF BUILDINGS AND WORKERS.
5. KEEP EXITS, EXIT ACCESSES, EXIT DISCHARGES, AND PUBLIC WAYS CLEAR AT ALL TIMES.
6. VERIFY LOCATION AND EXTENT OF DEMOLITION WORK FOR ALL TRADES NECESSARY FOR THE WORK WHETHER INDICATED OR NOT.
7. PROVIDE AND MAINTAIN PARTITIONS/BARRIERS AS REQUIRED TO PREVENT SPREAD OF DUST, FUMES, SMOKE, ETC. TO OTHER PARTS OF THE BUILDING. ON COMPLETION, REMOVE PARTITIONS AND REPAIR DAMAGED SURFACES TO MATCH ADJACENT SURFACES
8. PROTECT ADJACENT AREAS AND EXISTING BUILDING ELEMENTS / COMPONENTS TO REMAIN FROM POTENTIAL DAMAGES RESULTING FROM DEMOLITION WORK.
9. REPAIR DAMAGES TO ADJACENT SURFACES, ETC. WHERE AFFECTED BY DEMOLITION WORK.
10. IF DEMOLITION IS PERFORMED BEYOND THAT IS REQUIRED, RESTORE AFFECTED AREAS AT NO COST TO THE OWNER.
11. NOTIFY OWNER BEFORE DEMOLITION BEGINS IN OCCUPIED AREAS.
12. KEEP AREAS CLEAN AND HAZARD-FREE THROUGHOUT DURATION OF DEMOLITION WORK. LEAVE AREAS BROOM CLEAN READY FOR NEW WORK.
13. REMOVE [FROM SITE DAILY] AND LEGALLY DISPOSE OF DEBRIS, RUBBISH, AND OTHER MATERIALS RESULTING FROM DEMOLITION WORK.
14. NO EXISTING WORK BY OWNER SHALL BE REMOVED UNLESS SUCH REMOVAL IS APPROVED IN WRITING BY OWNER.
15. NOTIFY OWNER OF UTILITIES, PIPES, CONDUIT, AND OTHER ELEMENTS FOUND WITHIN DEMOLITION AREA THAT ARE NOT SHOWN ON DRAWINGS.
14. CONTRACTOR TO OBTAIN AND PAY FOR PERMIT FEES.
15. REFER TO CIVIL DRAWING FOR SCARIFYING & GRADING OF SITE.
16. EXTENT OF CONSTRUCTION SHALL BE COORDINATED WITH CIVIL & LANDSCAPEING WORKS.

Sheet No. ____ of ____

IF SHEET IS LESS THAN 24" X 36" REDUCED PRINT – USE GRAPHIC SCALES

GENERAL NOTES

-GENERAL CONSTRUCTION NOTES

1. OBSERVE & COMPLY WITH ALL FEDERAL AND LOCAL LAWS REQUIRED FOR THE PROTECTION OF PUBLIC HEALTH, SAFETY & ENVIRONMENTAL QUALITY.
2. THE FINISHED GRADE INDICATED HEREON SHALL MATCH OR CONNECT TO ADJACENT EXISTING GROUND AS SHOWN ON THE GRADING PLANS. ANY DISCREPANCY DISCOVERED DURING THE COURSE OF CONSTRUCTION SHALL BE IMMEDIATELY REPORTED TO THE CONSTRUCTION MANAGER.
3. ALL DEBRIS AND TRASH FROM CONSTRUCTION SHALL BE DISPOSED OF TO THE APPROVED LANDFILL SITE AND THE CONTRACTOR SHALL COMPLY WITH ALL THE REQUIREMENTS PERTAINING TO THE USE OF DISPOSAL AREA.
4. THE EXISTENCE AND LOCATION OF EXISTING UNDERGROUND UTILITIES AND STRUCTURES SHOWN IN THE PLANS ARE BASED ON THE LATEST AVAILABLE DATA DURING THE TIME OF SURVEY BUT NO GUARANTY AS TO THEIR ACCURACY. THE CONTRACTOR MUST SECURE UNDERGROUND CLEARANCES TO ALL UTILITY AGENCIES INVOLVE AND SHALL BE RESPONSIBLE FOR VERIFYING THE LOCATION OF EXISTING UTILITIES AND EXERCISE CAUTION WHEN EXCAVATING IN THE AREA. ANY DAMAGES TO EXISTING UTILITIES AND STRUCTURES RESULTING FROM CONTRACTOR'S OPERATIONS SHALL BE REPAIRED AT NO ADDITIONAL COST TO OWNER.
5. EXISTING UTILITIES SHALL REMAIN IN SERVICE AND IN PLACE AT ALL TIMES, UNLESS NOTED OTHERWISE. INTERRUPTION OF SERVICE SHALL BE KEPT TO A MINIMUM AND SHALL BE DONE AT THE CONTRACTOR'S EXPENSE AND ONLY WITH THE APPROVAL OF THE OWNER'S REPRESENTATIVE AND UTILITY COMPANIES.
6. THE CONTRACTOR SHALL BE RESPONSIBLE FOR PROPERLY SHEETING AND BRACING THE EXCAVATION AND STABILIZING THE EXISTING GROUND TO PROVIDE SAFE AND SECURE FROM POTENTIAL SLIDING, CAVE-INS, SETTLEMENT.
7. THE CONTRACTOR SHALL PROVIDE SAFE ACCESS TO AND FROM ALL DRIVEWAYS AND STREETS NEAR THE PROJECT SITE.
8. RESTORE TO THEIR ORIGINAL CONDITION EQUAL OR BETTER, ALL EXISTING IMPROVEMENTS DAMAGED AS A RESULT OF CONSTRUCTION ACTIVITIES, INCLUDING PAVEMENTS, EMBANKMENTS, DRIVEWAYS, CURBS, SIGNS, LANDSCAPING, STRUCTURES, UTILITIES, FENCES, ETC..
9. PROPERTY CORNERS AND ROAD MONUMENTS SHOWN ON THE PLANS OR DISCOVERED DURING CONSTRUCTION SHALL BE PRESERVED AND NOT TO BE DISTURBED. IN ANY CASE, IF THE CONTRACTOR DISTURBS ANY OF THESE MARKERS OR MONUMENTS, THEY SHALL BE REPAIRED AND RESTORED TO THEIR ORIGINAL OR BETTER CONDITION AT NO ADDITIONAL COST TO OWNER.
10. THE CONTRACTOR MUST SECURE UNDERGROUND TELEPHONE, CABLE, POWER, WATER, AND WASTEWATER CLEARANCES PRIOR TO ANY EXCAVATIONS. ANY DAMAGES AND REPAIRS TO UNDERGROUND UTILITIES SHALL BE BORNE BY THE CONTRACTOR. ALL RELOCATION COSTS OR REQUESTS FOR IMPROVEMENT OF FACILITIES, INCLUDING MATERIAL & LABOR SHALL BE BURDENED BY THE CONTRACTOR OR REQUESTING AGENCY. EITHER PARTY SHALL MAKE APPLICATION & SUBMIT APPROVED RELOCATION PLANS TO RESPONSIBLE AGENCY OR AGENCIES PRIOR TO ANY RELOCATION WORK.
11. EXCAVATIONS WITHIN 5 TO 10 FEET FROM EXISTING POWER POLES AND DEEPER THAN 3 FEET SHALL HAVE TRENCH SHORING. IF EXCAVATION IS DEEPER THAN 3 FEET AND WITHIN 5 FEET FROM AN EXISTING POWER POLE, THE POWER POLE SHALL BE RELOCATED. IN ANY CASE, THE CONTRACTOR SHALL PROTECT THE INTEGRITY OF THE POLE FOUNDATION. ALL RELOCATION COSTS INCLUDING LABOR AND MATERIALS SHALL BE BORNE BY THE CONTRACTOR. THE CONTRACTOR SHALL SUBMIT/MAKE APPLICATION WITH GPA AND SUBMIT GPA APPROVED RELOCATION PLANS PRIOR TO ANY MATERIALS ISSUED OR INSPECTIONS PERFORMED BY GPA. PROVIDE 12 INCHES MINIMUM CLEARANCE BETWEEN GPA POWER CONDUITS AND ALL NEW INSTALLATIONS. THE CONTRACTOR SHALL SECURE WORK CLEARANCE WITH GPA PRIOR TO EXCAVATION.
12. ALL OTHER EXISTING UTILITY APPURTENANCES THAT ARE NOT SHOWN IN THE PLANS SUCH AS MANHOLE, VALVE BOXES, WATER METER, ETC. THAT ARE OR WILL BE AFFECTED BY THE NEW CONSTRUCTION SHALL BE ADJUSTED OR RELOCATED ACCORDINGLY.
13. LOCATION OF OTHER EXISTING UTILITY STRUCTURES THAT ARE NOT SHOWN IN THE PLANS BUT UNCOVERED DURING THE CONSTRUCTION SHALL BE RECORDED OR DOCUMENTED AND MUST BE REFLECTED IN THE AS-BUILT (RECORD) DRAWINGS.

-EROSION/TEMPORARY DUST CONTROL

1. DURING CONSTRUCTION, PREVENTIVE MEASURES SHALL BE USED TO CONTROL OR MINIMIZE DUST, EROSION OR SEDIMENTATION PROBLEMS WHICH MAY ARISE AS WORK PROGRESSES. SPRINKLE OR TREAT WITH DUST SUPPRESSANT THE WORK AREA, HAUL ROADS, AND OTHER AREAS AFFECTED BY OR DISTURBED BY THE CONSTRUCTION ACTIVITIES.
2. THE CONTRACTOR SHALL INSTALL TEMPORARY EROSION CONTROL MEASURES TO PREVENT EROSION OR SEDIMENTATION WITHIN THE PROJECT SITE AND ADJACENT PROPERTIES. EROSION CONTROL MEASURES MAY BE FROM SILT FENCES, SAND BAGS, OR ANY OTHER MEANS BEST SUITED FOR THE INTENDED PURPOSE.
3. PROVIDE PREVENTIVE EROSION CONTROL MEASURES ON ALL CUT & FILL SLOPES AS PER GEPA AND SWPPP REQUIREMENTS.

-EROSION & SEDIMENT CONTROL INSPECTION & MAINTENANCE PRACTICES

1. ALL CONTROL MEASURES MUST BE INSPECTED AT LEAST ONCE A WEEK AND FOLLOWING ANY RAINFALL EVENT OF 0.5 INCHES OR GREATER.
2. ALL MEASURES MUST BE MAINTAINED IN GOOD WORKING ORDER. IF REPAIR IS NECESSARY, IT MUST BE INITIATED WITHIN 24 HOURS AFTER THE INSPECTIONS
3. A MAINTENANCE INSPECTION REPORT MUST BE MADE PROMPTLY AFTER EACH INSPECTION BY THE CONTRACTOR.
4. THE CONTRACTOR MUST SELECT A MINIMUM OF ONE PERSON WHO WILL BE RESPONSIBLE FOR INSPECTIONS. MAINTENANCE AND REPAIR ACTIVITIES AND FILLING OUT THE INSPECTION AND MAINTENANCE REPORT.
5. PERSONNEL SELECTED FOR THE INSPECTION AND MAINTENANCE RESPONSIBILITIES MUST RECEIVE TRAINING FROM THE CONTRACTOR. THEY MUST BE TRAINED IN ALL THE INSPECTION AND MAINTENANCE PRACTICES NECESSARY FOR KEEPING THE EROSION AND SEDIMENT CONTROLS USED ON-SITE IN GOOD WORKING ORDER.
6. THE AREA OF LAND TO BE GRADE AT ANY ONE TIME DURING DEVELOPMENT OR CONSTRUCTION MUST BE KEPT TO A MINIMUM. GRADED AREAS CANNOT REMAIN UNSTABILIZED FOR A PERIOD EXCEEDING TWO (2) MONTHS.
7. ALL DISTURBED AREAS, SLOPES, CHANNELS, DITCHES AND BANKS MUST BE STABILIZED AS SOON AS POSSIBLE AFTER THE FINAL GRADE HAS BEEN COMPLETED.
8. STORMWATER RUNOFF FROM DISTURBED AREAS OF A PROJECT MUST BE COLLECTED AND DIVERTED TO FACILITIES FOR REMOVAL OF SEDIMENT PRIOR TO DISCHARGE TO ANY SURFACE OR MAIN WATERS OF THE TERRITORY.
9. CONTRACTOR MUST PROVIDE CONCRETE WASH AREA FOR PROJECT. SEE SHEET 3/C2.2 FOR DETAIL.
10. EROSION AND SEDIMENT CONTROL MEASURES SHOWN ON THE PLANS REPRESENT THE MINIMUM REQUIREMENTS. CONTRACTOR MUST ADJUST EROSION AND SEDIMENT CONTROL MEASURES TO PROVIDE THE BEST MANAGEMENT PRACTICES TO ADDRESS THE REQUIREMENTS OF GUAM PUBLIC LAW 25-12 AMEND, THE GUAM ENVIRONMENTAL SEDIMENTATION CONTROL REGULATIONS, AND AS CONSTRUCTION PHASING AND SEQUENCING REQUIRES. ANY REVISIONS AND/OR CHANGES AS A RESULT OF THESE CONDITIONS MUST REQUIRE REVIEW AND APPROVAL BY THE CONSTRUCTION MANAGER.

-ENVIRONMENTAL PROTECTION

1. ALL CONSTRUCTION ACTIVITIES MUST BE IN CONFORMANCE WITH APPLICABLE FEDERAL LAWS, REGULATIONS, ORDINANCES AND ALL APPLICABLE STATION REQUIREMENTS FOR POLLUTION CONTROL. BEST MANAGEMENT PRACTICES MUST BE EMPLOYED AT ALL TIMES DURING CONSTRUCTION.
2. NO BURNING OR BURYING OF DEBRIS AND/OR WASTE MATERIAL. EXCEPT FOR MATERIALS WHICH ARE SPECIFICALLY INDICATED ON THE PLANS OR SPECIFICATIONS AS SUITABLE FOR BACKFILL MUST BE PERMITTED ON THE SITE.
3. ALL UNUSABLE DEBRIS AND WASTE MATERIAL MUST BE TRANSPORTED TO A LANDFILL. ALL GREEN WASTE MUST BE DISPOSED FOLLOWING THE APPROVED HAZARD ANALYSIS AND CRITICAL CONTROL POINT (HACCP) MEASURES.
4. ALL NECESSARY PRECAUTIONS MUST BE TAKEN TO PREVENT THE POLLUTION OF WATER RESOURCES FROM FUELS, OILS, BITUMENS, CALCIUM CHLORIDE, HERBICIDES, PESTICIDES, CHEMICALS, OR OTHER HARMFUL MATERIALS.

-TURF ESTABLISHMENT

1. NEWLY GRADED SLOPES AND EMBANKMENTS, LANDSCAPE AREA AND AREAS DISTURBED DURING CONSTRUCTION, EXCEPT FOR PONDING BASIN, SHALL BE PROVIDED WITH 4" THICK TOP SOIL AND PLANTED WITH SEEDS OR TURF APPROPRIATE FOR THE TYPE OF SOILS AT THE SITE. COORDINATE WITH THE ENGINEER FOR TYPE OF SEED OR PLANTINGS TO BE USED. MAKE USE OF EXISTING TOP SOILS AT THE SITE, AS MUCH AS POSSIBLE. THE CONTRACTOR SHALL BE RESPONSIBLE FOR MAINTENANCE OF SEEDS OR PLANTINGS UNTIL A 95% GROUND COVER IS ATTAINED.

-TRAFFIC CONTROL NOTES, AS NEEDED

1. THE CONTRACTOR SHALL PROVIDE AND MAINTAIN ALL NECESSARY SIGNS, LIGHTS, FLARES, BARRICADES, MARKERS, CONES, AND OTHER PROTECTIVE FACILITIES AND SHALL CONFORM WITH THE LOCAL TRAFFIC REGULATIONS AND THE CURRENT U.S. FEDERAL HIGHWAY ADMINISTRATION "MANUAL ON UNIFORM TRAFFIC CONTROL DEVICES" (MUTCD) FOR STREETS AND HIGHWAYS, PART VI – STANDARDS AND GUIDES FOR TRAFFIC CONTROLS FOR STREET AND HIGHWAY CONSTRUCTION, MAINTENANCE, UTILITY, AND INCIDENT MANAGEMENT OPERATIONS.
2. DURING NON-WORKING HOURS, ALL LANES OF ROADWAY SHALL BE OPEN TO TRAFFIC. ALL TRENCHES SHALL BE COVERED WITH A SAFE NONSKID BRIDGING MATERIAL WITH SUITABLE MATERIAL AT THE EDGES TO PROVIDE A SMOOTH TRANSITION.
3. THE CONTRACTOR SHALL REPLACE OR REPAIR ALL TRAFFIC SIGNS, POSTS, AND MARKINGS DISTURBED BY THE CONTRACTOR'S ACTIVITIES TO EXISTING CONDITIONS OR BETTER.
4. THE CONTRACTOR SHALL COORDINATE ALL TRAFFIC CONTROL PLANS WITH THE DOCOMO PACIFIC, GUAM'S REPRESENTATIVE AND DEPARTMENT OF PUBLIC WORKS.
5. COMPLY WITH GOVERNMENT OF GUAM REQUIREMENTS FOR WORK ALONGSIDE PUBLIC HIGHWAYS. SUBMIT TRAFFIC CONTROL PLAN, AS REQUIRED, TO SECURE CLEARANCES AND PERMITS.

-DRAWING UNITS

1. ALL COORDINATES, RADIUS STATIONING, AND DIMENSIONS SHOWN ARE IN FEET, UNLESS OTHERWISE NOTED.
2. CONTROL POINTS REFERENCE (STATION/OFFSET DISTANCE AND COORDINATES)
   - A. MANHOLES: AT CENTER OF STRUCTURE
   - B. INLET: AT CENTER OF INLET

SURVEY NOTES

1. HORIZONTAL CONTROL SURVEY WAS BASED ON FOUND CORNERS AND GUAM GEODETIC NETWORK (GGN) MONUMENT NO. 642 AS SHOWN IN SHEET C1.3.
2. VERTICAL DATUM IS BASED ON GUAM GEODETIC NETWORK (GGN) MONUMENT NO. 642 WITH AN ELEVATION OF 451.11' MEAN SEA LEVEL (MSL).
3. BEARINGS AND DISTANCES ARE 1993 GRID AND ARE FIELD CONDITIONS.
4. ALL DISTANCES, COORDINATES, DIMENSIONS AND ELEVATIONS AS SHOWN ARE IN FEET AND DECIMALS THEREOF.
5. CONTOURS WERE DEVELOPED FROM SPOT ELEVATIONS USING STANDARD GROUND TOPOGRAPHY METHOD.

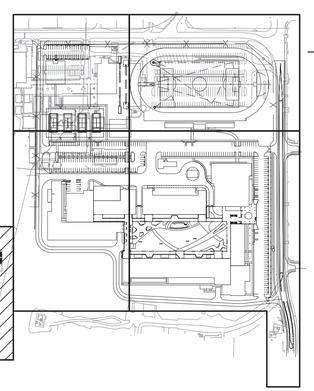
GRADING AND DRAINAGE PLAN - 5

SCALE: 1"=40'-0"

LEGEND:

- 438 — FINISHED GRADE
- 438 — EXISTING GRADE
- SD SD — DRAINAGE LINE
- STORM DRAINAGE MANHOLE
- FLOW LINE
- CATCH BASIN
- HEADWALL

KEYNOTES:



1. STORM DRAINAGE MANHOLE (SDMH) — 2 C9.6
2. CATCH BASIN (TYPE-1) — 1 C9.7
3. HEADWALL (HW) — 1 C9.6
4. DRAINAGE PIPE TRENCH — 3 C9.7
5. RETAINING WALL WITH CHAIN LINK FENCE — 4 C9.11
6. CONCRETE-LINED TRAPEZOIDAL SWALE — 3 C9.5

NOTE:

1. FOR DRAINAGE PROFILES, SEE SHEETS C8.1 – C8.5
2. PLACED RIPRAP IS ROCK PLACED ON A PREPARED SURFACE TO FORM A WELL-GRADED MASS. PLACE RIPRAP TO ITS FULL THICKNESS IN ONE OPERATION TO AVOID DISPLACING THE UNDERLYING MATERIAL. DO NOT PLACE RIPRAP MATERIAL BY METHOD THAT CAUSE SEGREGATION OR DAMAGE TO THE PREPARED SURFACE. PLACE OR REARRANGE INDIVIDUAL ROCKS BY MECHANICAL OR HAND METHODS TO OBTAIN A DENSE UNIFORM BLANKET WITH A REASONABLY SMOOTH SURFACE.
3. FURNISHED HARD, DURABLE, ANGULAR ROCK THAT IS RESISTANT TO WEATHERING AND WATER ACTION AND FREE OF ORGANIC OR OTHER UNSUITABLE MATERIAL. DO NOT USE SHALE, ROCK WITH SHALE SEAMS, OR OTHER FISSILE OR FISSURED ROCK THAT MAY BREAK INTO SMALLER PIECES IN THE PROCESS OF HANDLING AND PLACING. ROCK SIZE TO BE FROM 6 TO 14 INCHES WITH MASS OF ABOUT 40 TO 220 POUNDS.
4. PLACE RIPRAP TO ITS FULL THICKNESS IN ONE OPERATION TO AVOID DISPLACING THE UNDERLYING MATERIAL. DO NOT PLACE RIPRAP MATERIAL BY METHODS THAT CAUSE SEGREGATION OR DAMAGE TO THE PREPARED SURFACE. PLACE OR REARRANGE INDIVIDUAL ROCKS BY MECHANICAL OR HAND METHODS TO OBTAIN A DENSE UNIFORM BLANKET WITH A REASONABLY SMOOTH SURFACE.

NOT TO SCALE

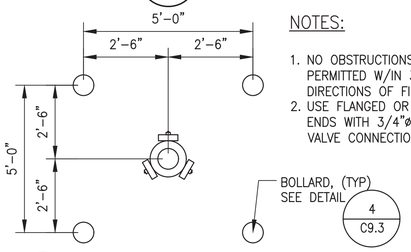
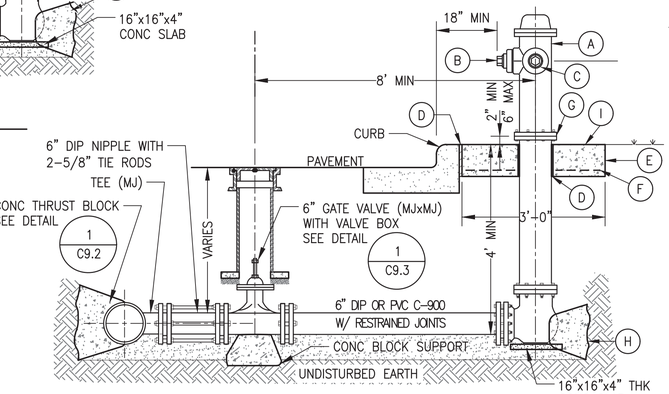
3B CUT-IN CONNNECTION
NOT TO SCALE



WET TAPPING CONNECTION NOTES:

1. TAPPING SLEEVE MUST BE 316 STAINLESS STEEL WITH MECHANICAL JOINT CONNECTION AND VALVE SHALL BE MJxMJ VALVE. TAPPING SLEEVE WITH FLANGED CONNECTION AND FExMJ VALVE MAY BE ACCEPTED WITH THE APPROVAL OF GWA ENGINEER.
2. CONTRACTOR SHALL VERIFY THE LOCATION, SIZE, MATERIAL AND DEPTH OF THE EXISTING WATER MAIN BEFORE TAPPING. TAPPING SHALL BE PERFORMED WITH THE PRESENCE OF A GWA INSPECTOR.
3. TAPPING SLEEVE SHALL BE 24" MINIMUM SEPARATION FROM ANY BELL, COUPLING, VALVE, FITTING, OR ANOTHER TAPPING LOCATED ALONG EXISTING WATER MAIN TO BE TAPPED.
4. ALL CONNECTIONS TO THE EXISTING MAINS SHALL BE MADE AFTER THE NEW WATER MAIN PASSES THE REQUIRED TESTS AND APPROVED BY GWA IN THE PRESENCE OF AN AUTHORIZED GWA REPRESENTATIVE.
5. ALL FITTINGS SHALL BE SWABBED WITH CHLORINE SOLUTION OF 50 PPM (MG/L) MINIMUM CONCENTRATION.
6. NUTS AND BOLTS MUST BE STAINLESS STEEL TYPE 304 OR 316.
7. CONCRETE SHALL NOT CONTACT BOLTS, NUTS OR END OF MECHANICAL JOINT FITTINGS.

3 CONNECTION TO EXIST MAIN
NOT TO SCALE



2C W/O CURB AND GUTTER

NOT TO SCALE

NOTES:

1. THE SCHEDULE AND DETAILS AS SHOWN ARE PROVIDED AS A GUIDE ONLY. CALCULATIONS ARE BASED ON PRESSURE OF 250 PSI, AND IS APPLICABLE TO PRESSURE OF A LESSER AMOUNT.
2. ACTUAL FIELD CONDITIONS AND SOIL TYPE SHALL BE VERIFIED IN THE FIELD. THE CONTRACTOR OR ENGINEER WHO PREPARED THE PLANS SHALL SUBMIT THE FINAL DESIGN AND DETAILS TO THE MANAGER FOR REVIEW AND APPROVAL AFTER FIELD VERIFICATION PRIOR TO INSTALLATION.
3. CONCRETE SHALL HAVE A MINIMUM COMPRESSION STRENGTH OF 2500 PSI AND SHALL BE POURED AGAINST UNDISTURBED EARTH.
4. THRUST BLOCK IS TO EXTEND TO UNDISTURBED SOIL.
5. KEEP CONCRETE CLEAR OF MJ OR BELL AND SPIGOT JOINTS.
6. BLOCK IN A SIMILAR MANNER AT TEES, HYDRANTS, PLUG OR OTHER LOCATIONS AS REQUIRED.
7. SIZE MAY BE DECREASED FOR LESSER DEGREE BENDS AS DETERMINED BY ENGINEER.
8. WHEN NECESSARY ADDITIONAL THRUST RESTRAINT METHODS MAY BE USED, SUCH AS MECHANICAL JOINT RESTRAINTS, TIE-RODS RECOMMENDATIONS) OR OTHER APPROVED METHODS.
9. ALL VERTICAL FITTINGS AND JOINTS SHALL BE RESTRAINED. NO VERTICAL THRUST BLOCKS.

NOTES:

1. CONTRACTOR SHALL APPLY AND OBTAIN ENCROACHMENT PERMITS PRIOR TO THE START OF ANY WORK IN RIGHT OF WAY.
2. CONTRACTOR SHALL NOTIFY DPW'S HIGHWAY PROJECT DEVELOPMENT AND CONSTRUCTION (HPDC) SECTION 48 HOURS PRIOR TO START OF WORK.
3. CONTRACTOR SHALL BE RESPONSIBLE FOR THE SHORING OF TRENCH TO ENSURE SAFE ACCESS FOR WORKERS.
4. DPW RECOMMENDS 7 DAYS CURE TIME FOR THE FLOWABLE FILL PRIOR TO PAVEMENT RESTORATION. CONTRACTOR SHALL BE RESPONSIBLE TO PROVIDE ADEQUATE PROTECTION FOR THE FLOWABLE FILL FROM VEHICULAR LOADING DURING THIS CURING PERIOD. LANE CLOSURE SHALL NOT BE USED AS AN OPTION DURING THIS CURING PERIOD.
5. APPROVED SELECT FILL MATERIAL BETWEEN FLOWABLE FILL AND BEDDING MATERIAL SHALL BE COMPACTED TO 95% OF MAXIMUM DENSITY AT EVERY 8" LIFTS.
6. ALL RIGHT OF WAY RESTORATION WORK SHALL BE PER DEPARTMENT OF (DPW) APPROVAL.
7. NON-DETECTABLE UNDERGROUND UTILITY WARNING TAPE (6" WIDE) IS REQUIRED FOR ALL WATER PIPE (METAL AND NON-METAL) IN THE RIGHT WAY OF OR EASEMENTS.

NOT FOR CONSTRUCTION

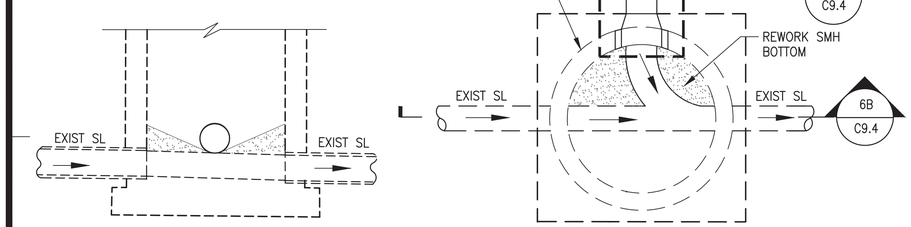
PIPE INSTALLATION NOTES:



1. CENTER PIPE IN CONNECTOR OPENING.
2. POSITION CLAMP TAKE-UPS 90° APART. USING T-HANDLE TORQUE WRENCH (P/N 80090), TIGHTEN THE TWO SETS OF CLAMPS ALTERNATELY TO 60 IN LBS.
3. INSPECT CONNECTOR TO ENSURE THAT TAKE-UP IS UNIFORM AND RUBBER IS EVENLY COMPRESSED AROUND PIPE.
4. ON MINIMUM PIPE OD INSTALLATIONS, LIFT THE RUBBER UP UNDERNEATH THE PIPE CLAMP SCREW SO THAT THE CONNECTOR CONTACTS THE BOTTOM SURFACE OF THE PIPE WHILE THE PIPE CLAMP SCREW IS BEING TIGHTENED. APPLICATION OF PIPE LUBRICATION ON UNDERSIDE OF THE CLAMP WILL ALSO HELP ASSURE THAT AN EVEN CONTRACTION OF RUBBER IS MAINTAINED THROUGHOUT THE CLAMPING AREA.
5. AFTER THE PIPE CLAMP HAS BEEN TIGHTENED DOWN FIRMLY, MOVE THE PIPE HORIZONTALLY AND/OR VERTICALLY TO BRING IT TO GRADE.

Sheet No. _____ of _____

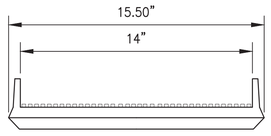
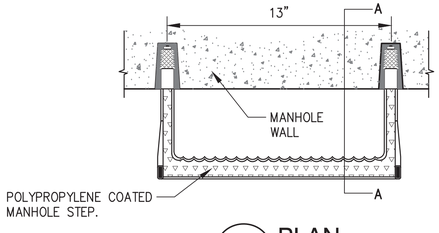
PLACED RIPRAP NOTES:



1. PLACED RIPRAP IS ROCK PLACED ON A PREPARED SURFACE TO FORM A WELL-GRADED MASS. PLACE RIPRAP TO ITS FULL THICKNESS IN ONE OPERATION TO AVOID DISPLACING THE UNDERLYING MATERIAL. DO NOT PLACE RIPRAP MATERIAL BY METHOD THAT CAUSE SEGREGATION OR DAMAGE TO THE PREPARED SURFACE. PLACE OR REARRANGE INDIVIDUAL ROCKS BY MECHANICAL OR HAND METHODS TO OBTAIN A DENSE UNIFORM BLANKET WITH A REASONABLY SMOOTH SURFACE.

2. FURNISHED HARD, DURABLE, ANGULAR ROCK THAT IS RESISTANT TO WEATHERING AND WATER ACTION AND FREE OF ORGANIC OR OTHER UNSUITABLE MATERIAL. DO NOT USE SHALE, ROCK WITH SHALE SEAMS, OR OTHER FISSILE OR FISSURED ROCK THAT MAY BREAK INTO SMALLER PIECES IN THE PROCESS OF HANDLING AND PLACING. ROCK SIZE TO BE FROM 6 TO 14 INCHES WITH MASS OF ABOUT 40 TO 220 POUNDS.



3. PLACE RIPRAP TO ITS FULL THICKNESS IN ONE OPERATION TO AVOID DISPLACING THE UNDERLYING MATERIAL. DO NOT PLACE RIPRAP MATERIAL BY METHODS THAT CAUSE SEGREGATION OR DAMAGE TO THE PREPARED SURFACE. PLACE OR REARRANGE INDIVIDUAL ROCKS BY MECHANICAL OR HAND METHODS TO OBTAIN A DENSE UNIFORM BLANKET WITH A REASONABLY SMOOTH SURFACE.

GENERAL LANDSCAPE NOTES:

1. INSPECT THE SITE AND VERIFY CONDITIONS PRIOR TO COMMENCING WITH THE WORK. DISCREPANCIES SHALL BE BROUGHT TO THE ATTENTION OF THE OFFICER-IN-CHARGE. BY COMMENCING WITH THE WORK, THE CONTRACTOR ACCEPTS THE EXISTING CONDITIONS AND RESPONSIBILITY FOR MAINTAINING THOSE CONDITIONS.
2. PRIOR TO COMMENCEMENT OF CONSTRUCTION THE CONTRACTOR TOGETHER WITH THE OFFICER-IN-CHARGE MUST IDENTIFY THE LOCATION OF EXISTING UTILITIES, SITE FURNISHINGS, PAVING, AND OTHER EXISTING FEATURES TO REMAIN. PHOTO DOCUMENT CURRENT CONDITIONS AND PROTECT FROM ANY DAMAGE, DIRT, DUST, AND DEBRIS CAUSED BY CONSTRUCTION.
3. NOTIFY ALL NECESSARY UTILITY COMPANIES 48 HOURS MINIMUM PRIOR TO DIGGING FOR VERIFICATION OF ALL UNDERGROUND UTILITIES, AND OTHER OBSTRUCTIONS AND COORDINATE WITH THE OFFICER-IN-CHARGE PRIOR TO INITIATING OPERATIONS.
4. COORDINATE ALL WORK WITH RELATED CONTRACTORS AND WITH THE GENERAL CONSTRUCTION OF THE PROJECT IN ORDER NOT TO IMPEDE THE PROGRESS OF THE WORK OF OTHERS OR THE CONTRACTOR'S OWN WORK.
3. FIELD LAYOUT AND MARK THE LOCATION, ALIGNMENT AND FINE GRADING ELEVATION PROFILE OF THE PROPOSED IMPROVEMENTS AND OBTAIN APPROVAL OF THE LAYOUT AND FINISH ELEVATIONS PRIOR TO START OF THE WORK. THE OFFICER-IN-CHARGE RESERVES THE RIGHT TO REVISE THE LAYOUT AND FINISH ELEVATIONS OF THE PROPOSED IMPROVEMENTS PRIOR TO START OF THE WORK. THE OWNER'S REPRESENTATIVE SHALL BE RESPONSIBLE TO MAKE THE ADJUSTMENTS AT NO ADDITIONAL COST.
4. FIELD ADJUST LOCATIONS OF PLANT MATERIAL AS NECESSARY TO AVOID DAMAGE TO EXISTING UNDERGROUND UTILITIES AND / OR EXISTING ABOVE GROUND ELEMENTS. ALL CHANGES REQUIRED SHALL BE COMPLETED AT THE CONTRACTOR'S EXPENSE AND SHALL BE COORDINATED WITH THE OFFICER-IN-CHARGE.
5. THE EXISTENCE AND LOCATION OF EXISTING STRUCTURES, UTILITIES AND APPURTENANCES SHOWN OR NOTED ON THESE PLANS ARE FROM THE LATEST AVAILABLE DRAWINGS AND FIELD OBSERVATIONS AND ARE NOT GUARANTEED AS TO THE LOCATION NOR TO THE EXISTENCE OF OTHER OBSTACLES WHICH MAY BE ENCOUNTERED. DISCREPANCIES SHALL BE REPORTED TO THE OFFICER-IN-CHARGE. REASONABLE MODIFICATIONS TO ACCOMMODATE SITE CONDITIONS SHALL NOT CONSTITUTE A RIGHT TO ADDITIONAL FUNDS.
6. EXISTING STRUCTURES, UTILITIES AND APPURTENANCES ADJACENT TO CONSTRUCTION LIMITS SHALL BE PROTECTED. EXISTING STRUCTURES, UTILITIES AND APPURTENANCES DAMAGED BY WORK UNDER THIS CONTRACT SHALL BE REPAIRED AT THE CONTRACTOR'S EXPENSE TO THE SATISFACTION OF THE OFFICER-IN-CHARGE.
7. DISCREPANCIES SHALL BE REPORTED TO THE OFFICER-IN-CHARGE REASONABLE MODIFICATIONS TO ACCOMMODATE SITE CONDITIONS SHALL NOT CONSTITUTE A RIGHT TO ADDITIONAL PROJECT COST.
8. THE CONTRACTOR SHALL NOT DEVIATE FROM THE DRAWINGS AND SPECIFICATIONS. IN THE EVENT OF ERRORS OR DISCREPANCIES, THE CONTRACTOR SHALL IMMEDIATELY NOTIFY THE OFFICER-IN-CHARGE.
9. PROVIDE SAFEGUARDS AND EXERCISE CAUTION AGAINST INJURY OR DAMAGE OF EXISTING MATERIALS AND FINISHES, AND NEW SITE IMPROVEMENTS. VEHICLES SHALL NOT PASS OVER WALKWAYS AND CURBS, UNLESS PROTECTION HAS BEEN PROVIDED PER THE SPECIFICATIONS.
10. DO NOT STORE MATERIALS OR EQUIPMENT, OR OPERATE OR PARK EQUIPMENT NEAR OR UNDER THE BRANCHES OF EXISTING PLANTS AND TREES THAT ARE TO REMAIN, EXCEPT AS REQUIRED FOR CONSTRUCTION IN THOSE AREAS. REFER TO TREE PROTECTION NOTES AND DETAILS.
11. FIELD LAYOUT THE LOCATION, ALIGNMENT AND ELEVATION PROFILE OF THE PROPOSED IMPROVEMENTS AND OBTAIN APPROVAL OF THE LAYOUT AND FINISH ELEVATIONS PRIOR TO START OF EXCAVATION. THE OFFICER-IN-CHARGE. RESERVES THE RIGHT TO REVISE THE LAYOUT AND FINISH ELEVATIONS OF THE PROPOSED IMPROVEMENTS PRIOR TO START OF EXCAVATION. THE CONTRACTOR SHALL BE RESPONSIBLE TO MAKE THE ADJUSTMENTS AT NO ADDITIONAL PROJECT COST.

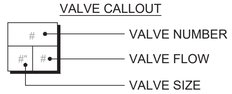
TEMPORARY IRRIGATION NOTES:

1. IRRIGATION SYSTEM IS SUBJECT TO FIELD ADJUSTMENTS DUE TO UNANTICIPATED SITE CONDITIONS. AVOID ANY CONFLICT BETWEEN UNDERGROUND UTILITIES, STRUCTURES AND PLANTINGS. THE CONTRACTOR MUST BE RESPONSIBLE FOR LOCATING AND PROTECTING ALL EXISTING UTILITIES.
2. UNLESS DIRECTED OTHERWISE, POTABLE WATER MUST BE READILY AVAILABLE TO THE CONTRACTOR AT NO EXPENSE TO THE CONTRACTOR.
3. CONTRACTOR MUST PROVIDE A TEMPORARY ABOVE-GRADE AUTOMATIC SYSTEM (TO BE APPROVED BY THE OFFICER IN CHARGE) FOR THE DURATION OF THE MAINTENANCE PERIOD AND NOT TO EXCEED ONE YEAR FROM ACCEPTANCE. THE TEMPORARY AUTOMATIC IRRIGATION SYSTEM MUST CONSIST OF, BUT IS NOT LIMITED TO, THE FOLLOWING:
   - A. AUTOMATIC IRRIGATION CONTROLLER INCLUDING A MINIMUM OF 3 INDEPENDENT PROGRAMS, 7 DAY PROGRAM CYCLE, AND 8 START TIMES PER PROGRAM PER DAY.
   - B. REDUCED PRESSURE BACKFLOW PREVENTER WITH STAINLESS STEEL ENCLOSURE
   - C. SHUT OFF AND ISOLATION VALVES.
   - D. PVC OR HDPE MAINLINE AND DISTRIBUTION LINES, INCLUSIVE OF JOINT RESTRAINT SYSTEMS IF NECESSARY TO PREVENT PIPE MOVEMENT DURING SYSTEM OPERATION.
   - E. SLOW CLOSING REMOTE CONTROL VALVES CONSTRUCTED OF GLASS FILLED NYLON AND INCLUDES: FABRIC-REINFORCED DIAPHRAGM, INTERNAL SCREEN SCRUBBER MECHANISM TO PREVENT DEBRIS CLOGGING, AND PRESSURE REGULATION.
   - F. GEAR DRIVEN ROTOR HEADS WITH ADJUSTABLE ARC, PRESSURE REGULATION, AND CHECK VALVES FOR LARGE RADIUS AREAS.
   - G. POP-UP SPRAY HEADS OR POP-UP STREAM ROTARY HEADS WITH PRESSURE REGULATION, CHECK VALVES, AND NOZZLES WITH MATCHED PRECIPITATION RATES FOR SMALL RADIUS AREAS.
   - H. ALL LABOR, MATERIALS AND APPURTENANCES REQUIRED TO INSTALL AND MAINTAIN THE TEMPORARY IRRIGATION SYSTEM.
4. CONTRACTOR MUST PROVIDE WATERING SCHEDULE. ALL IRRIGATION OPERATION MUST BE DURING "OFF PEAK" EVENING HOURS. OPERATION DURING OTHER TIMES MUST BE WITH THE APPROVAL OF THE OFFICER IN CHARGE.
5. PIPE SLEEVE MUST ALLOW FOR IRRIGATION PIPING AND THEIR RELATED COUPLINGS TO EASILY SLIDE THROUGH SLEEVE MATERIAL.
6. EXTEND SLEEVE 18" BEYOND EDGES OF PAVING OR CONSTRUCTED HARDSCAPE
7. MARK SLEEVE LOCATIONS ON SIDES OF PAVING OR WITH IRRIGATION FLAGS IN PLANTING AREA.
8. VERIFY ALL SLEEVE LOCATIONS WITH CONTRACTING OFFICER PRIOR TO CONSTRUCTION OF PAVING.
9. CONTRACTOR MUST COORDINATE INSTALLATION OF ALL SLEEVES AND CONDUITS UNDER PAVEMENT AND THROUGH WALLS. CONTRACTOR MUST ASSURE THAT THESE ITEMS ARE LAID PRIOR TO PLACEMENT OF PAVEMENT OR WALL STRUCTURES.
10. THE LANDSCAPE CONTRACTOR MUST REMOVE THE TEMPORARY IRRIGATION SYSTEM IN ITS ENTIRETY UPON COMPLETION OF THE MAINTENANCE PERIOD AND MUST REPAIR ANY AREAS DAMAGED DURING THE REMOVAL OF THE TEMPORARY IRRIGATION SYSTEM AT NO ADDITIONAL COST TO THE OWNER.



IDENTIFICATION REQUIREMENTS FOR NON-POTABLE,RECLAIMED WATER (R-1) IRRIGATION SYSTEM

1. HORIZONTAL AND VERTICAL CLEARANCES BETWEEN POTABLE WATER AND NON-POTABLE, RECLAIMED WATER LINES MUST CONFORM WITH THE "WATER RESOURCES MASTER PLAN" GUAM WATERWORKS AUTHORITY, VOL 3, CHAPTER 7 - WATER REUSE.
2. IDENTIFICATION TAPE MUST BE INSTALLED ON PRESSURE AND/OR NON-PRESSURE LATERALS. A PURPLE TAPE, SUGGESTED COLOR INDEX 77742 VIOLET #16, PANTONE 512 OR EQUAL, WITH WHITE OR BLACK LETTERING STATING "CAUTION: RECYCLED WATER - DO NOT DRINK," MUST BE FASTENED DIRECTLY TO THE TOP OF THE PIPE. THE TAPE MUST RUN CONTINUOUSLY THE ENTIRE LENGTH OF THE PIPE. THE OVERALL WIDTH OF THE TAPE MUST BE AT LEAST THREE (3) INCHES IN WIDTH. IT IS RECOMMENDED THAT THE IDENTIFICATION TAPE BE LOCATOR TYPE MARKING TAPE.
3. NEW ON-SITE PIPELINES MUST BE IDENTIFIED AS RECYCLED WATER PIPES BY USING A PURPLE COLOR CODE, SUGGESTED COLOR PANTONE 522 OR EQUAL FOR PIPE AND OTHER APPURTENANCES, SUGGESTED COLOR INDEX 77742 VIOLET #16, PANTONE 512 OR EQUAL FOR MARKING TAPES, LABELS AND SIGNS, AND MARKINGS, DIFFERENTIATING THEM FROM POTABLE WATER PIPING. THE WORDS "CAUTION: RECYCLED WATER - DO NOT DRINK," MUST BE PRINTED ON THE PIPE OR IDENTIFICATION TAPE. THIS STATEMENT MUST BE STAMPED ON OPPOSITE SIDES OF THE PIPE, REPEATED EVERY THREE FEET. ALL PIPING AND VALVES MUST ALSO BE APPROPRIATELY LABELED OR CONTINUOUSLY TAPED WITH APPROPRIATE IDENTIFICATION.
4. CONTROLLERS OF RECYCLED WATER MUST BE COLOR-CODED TO DIFFERENTIATE THE RECYCLED WATER FROM THE POTABLE WATER. CONTROLLERS MUST BE LABELED INSIDE AND OUTSIDE, WARNING THAT THE SYSTEM IS UTILIZING RECYCLED WATER. THE LABELS MUST ALSO ALERT THE SYSTEM'S OWNER/MAINTENANCE PERSONNEL OF ANY IMPORTANT CONSTRAINTS ON THE OPERATION OF THE SYSTEM.

IRRIGATION NOTES

1. IRRIGATION SYSTEMS SHOWN ON THE DRAWINGS ARE DIAGRAMMATIC AND ARE SUBJECT TO ADJUSTMENTS DUE TO UNANTICIPATED FIELD CONDITIONS. UNLESS OTHERWISE NOTED, LOCATE ALL SPRINKLER HEADS, VALVES, AND PIPES WITHIN PLANTING AREAS. AVOID ANY CONFLICT BETWEEN UNDERGROUND UTILITIES, STRUCTURES AND PLANTINGS. THE CONTRACTOR MUST BE RESPONSIBLE FOR LOCATING AND PROTECTING ALL EXISTING UTILITIES. BURY PRESSURE MAINLINES 24" DEEP MINIMUM FOR DECODER-BASED WIRING, AND LATERAL LINES 12" DEEP MINIMUM.
2. CONTRACTOR MUST INSTALL ALL IRRIGATION EQUIPMENT (IE. IRRIGATION LINES, CONTROL WIRES, VALVES, HEADS, ETC.) PER SPECIFICATIONS. EXISTING GATE VALVES, POINT OF CONNECTION, ETC. ARE DERIVED FROM THE BEST AVAILABLE INFORMATION AND ON-SITE INSPECTION. THE CONTRACTOR MUST VERIFY THOSE POINTS OF CONNECTION NOTED AND REPORT ANY DISCREPANCIES TO THE OFFICER IN CHARGE.
3. WITHIN 30 DAYS AFTER AWARD OF THE CONTRACT, SUBMIT FOR THE OFFICER-IN-CHARGE'S ACCEPTANCE SIX (6) COPIES OF DETAILED SCALED DRAWINGS AND WIRING DIAGRAMS FOR PERMANENT AND TEMPORARY IRRIGATION SYSTEMS. NOT PROPOSED DEVIATIONS FROM THE CONTRACT. INCLUDE SAMPLES OF MATERIALS, IF REQUIRED BY CONTRACT.
4. CONTRACTOR MUST SECURE ALL NECESSARY PERMITS AND OBSERVE ALL LOCAL CODES AND REGULATIONS. THE CONTRACTOR MUST CONFIRM ALL SITES DIMENSIONS AND CONDITIONS, AND REPORT ANY DISCREPANCIES TO THE OFFICER IN CHARGE.
5. THE IRRIGATION SYSTEM DESIGN IS BASED ON A MINIMUM STATIC WATER PRESSURE OF 65 PSI AT THE POINT OF CONNECTION. NOTIFY OFFICER IN CHARGE IF PRESSURE IS LESS THAN 65 PSI OR GREATER THAN 100 PSI.
6. CONTRACTOR IS RESPONSIBLE FOR THE COORDINATION OF THE INSTALLATION OF ALL SLEEVES, CONDUITS, MAINS AND LATERALS UNDER PAVEMENT AND THROUGH WALLS AND MUST ASSURE THAT THESE ITEMS ARE LAID PRIOR TO THE PLACEMENT OF PAVEMENT/WALL. STUB-OUTS AND CONDUITS RUNNING THROUGH THE BUILDING STRUCTURE WILL BE DONE BY OTHERS. ALL IRRIGATION WIRES MUST BE BUNDLED AND INSTALLED UNDER THE IRRIGATION MAIN FOR IN-GRADE INSTALLATION. INSTALL IRRIGATION WIRES IN CONDUITS WHERE WIRES ARE NOT FOLLOWING THE IRRIGATION MAIN AND ALL ABOVE-GRADE INSTALLATIONS. VERIFY UTILITY LOCATIONS BEFORE TRENCHING. CONTRACTOR MUST BE RESPONSIBLE FOR ANY DAMAGE TO UTILITIES AND EXISTING PLANTING TO REMAIN.
7. INSTALL SPRINKLER HEADS 6" AWAY FROM WALKWAYS, DRIVEWAYS AND 24" FROM STRUCTURES. FLEX RISERS MUST BE USED ON ALL SHRUB HEADS ON RISERS INSTALLED ALONG WALKWAYS, DRIVEWAYS AND PARKING SPACES. ADJUST ALL SPRINKLER HEADS TO OBTAIN BEST COVERAGE. ADJUST FLOW CONTROL OF CONTROL VALVES TO MINIMIZE MISTING.
8. PERFORM HYDROSTATIC TEST BY APPLYING CONTINUOUS STATIC PRESSURE OF 100PSI FOR ONE (1) HOUR. NOTIFY THE OFFICER-IN-CHARGE AT LEAST THREE (3) DAYS IN ADVANCE OF TEST. REPAIR LEAKS THAT DEVELOP AND REPEAT TEST. DO NOT BACKFILL UNTIL THERE IS NO FURTHER SIGN OF LEAKAGE.
9. PERFORM OPERABILITY TEST BY OPENING REMOTE CONTROL VALVE AND TEST CIRCUITS FOR LEAKS AROUND BARBED AND THREADED PVC FITTINGS. REPAIR LEAKS AND REPEAT TESTS. NOTIFY THE OFFICER-IN-CHARGE AT LEAST THREE (3) DAYS IN ADVANCE OF TEST. DO NOT BACKFILL UNTIL THERE IS NO FURTHER SIGN OF LEAKAGE.
10. PERFORM COVERAGE TEST. BEFORE PLANTING PERIOD, RUN AUTOMATIC CONTROLLER THROUGH ALL IT'S CYCLES. CHECK WATERING FOR PROPER COVERAGE AND UNIFORMITY IN COMPANY OF THE OFFICER-IN-CHARGE. RUN SYSTEM UNTIL THERE ARE PUDDLES OR THERE IS SHEET FLOW TO DETERMINE INITIAL IRRIGATION TIME AND NUMBER OF CYCLES PER WEEK NEEDED TO WATER REQUIREMENTS OF PLANTS.
11. THE CONTRACTOR, TOGETHER WITH THE OWNER'S MAINTENANCE REPRESENTATIVE MUST PROGRAM THE IRRIGATION CONTROLLER TO ACCOMMODATE THE LANDSCAPE AND SITE REQUIREMENTS, AND MUST INSTRUCT THE REPRESENTATIVE ON THE OPERATION OF THE COMPLETE SYSTEM. ALL IRRIGATION OPERATION MUST BE DURING "OFF PEAK" HOURS. OPERATION DURING OTHER TIMES MUST BE WITH THE APPROVAL OF THE OWNER.
12. AFTER INSTALLATION OF IRRIGATION, LANDSCAPE CONTRACTOR TO PROVIDE MARK-UP INFORMATION OF ANY CHANGES MADE IN THE FIELD TO THE FINAL DESIGN PLANS. PROVIDE THREE (3) REPRODUCIBLE COPIES DOCUMENTING THESE 'AS-BUILT' CONDITIONS TO THE OFFICER-IN-CHARGE UPON COMPLETION OF IRRIGATION INSTALLATION WORK OR THIRTY (30) DAYS BEFORE FINAL INSPECTION, WHICHEVER IS SOONER.

IRRIGATION PLAN NOTES

1. THIS PLAN IS DIAGRAMMATIC. LOCATE ALL MAINLINES, LATERALS, VALVES AND DISTRIBUTION EQUIPMENT WITHIN PLANTING AREAS UNLESS OTHERWISE NOTED. PLACE MAINLINE IN PLANTING AREAS WHERE NO SLEEVES ARE SHOWN. AVOID ALL CONFLICTS BETWEEN UNDERGROUND UTILITIES, STRUCTURES AND PLANTINGS. THE CONTRACTOR WILL BE RESPONSIBLE FOR LOCATING AND PROTECTING ALL UTILITIES.
2. PLACE ALL VALVES AND VALVE BOXES WITHIN GROUNDCOVER AREAS UNLESS OTHERWISE NOTED. CONTRACTOR MUST INSTALL VALVES IN SUCH A WAY AS TO BE AS INCONSPICUOUS AS POSSIBLE.
3. THE CONTRACTOR WILL BE RESPONSIBLE TO VERIFY THAT THE POINT-OF-CONNECTION (POC) HAS A STATIC PRESSURE OF 50 PSI AND WATER FLOW OF 50 GPM (MIN.). SEE ALSO IRRIGATION GENERAL NOTES REGARDING TESTING AND NOTIFICATION OF RESULTS. IF ANY OF THE POC INFORMATION SHOWN ON THESE DRAWINGS IS FOUND TO BE DIFFERENT THAN THE ACTUAL POC INFORMATION GATHERED ON THE FIELD, IMMEDIATELY NOTIFY THE OFFICER-IN-CHARGE AND IRRIGATION CONSULTANT.
4. SHOULD THE CONTRACTOR FAIL TO VERIFY THE POC INFORMATION, ANY CHANGES REQUIRED BY LOW PRESSURE OR VOLUME WILL BE THE SOLE RESPONSIBILITY OF THE CONTRACTOR. FAILURE TO NOTIFY IRRIGATION CONSULTANT MUST PLACE ALL REQUIRED REPAIRS / EQUIPMENT AND OTHER RELATED COSTS AT THE FULL RESPONSIBILITY OF THE IRRIGATION CONTRACTOR.
5. CONTRACTOR MUST ENSURE RUNNING MULTIPLE STATION CAPACITY AT 50 GPM (MAX.)
6. FOR IRRIGATION DETAILS SEE SHEETS L2.3 AND L2.4.

REFERENCE NOTES SCHEDULE

SYMBOL	QTY	DESCRIPTION
— — — —	3,500 LF	ROOT BARRIER (24" DEPTH), RECYCLABLE, BLACK, INJECTION MOLDED POLYPROPYLENE PANELS
– – – – – – – –	7,200 LF	POLY HEADER (5" LANDSCAPE EDGING, 1 INCH ROUND TOP BEAD, 100% RECYCLED, HIGH GRADE POLYETHYLENE WITH ANCHOR STAKES)
	211 CY	RED CINDER, 4" LAYER
	1,600	SYNTHETIC TURF (UNIFORM COLOR WITH CHARACTERISTICS OF CYNODON DACTYLON)
	75 CY	NO. 3 GRAVEL MAINTENANCE STRIP (3" LAYER)
	8,100 SF	FILTER FABRIC, WOVEN, INSTALL UNDER ALL GRAVEL AREAS
	8,300 CY	IMPORTED SCREENED TOP SOIL (4" LAYER)
	693,000 SF	SOIL PREPARATION (1" LAYER ORGANIC SOIL CONDITIONER OR APPROVED SUBSTITUTE / COMPOST, ROTOR-TILL 4" DEEP INTO SOIL)

PLANTING NOTES:

1. VERIFY ALL PLANT QUANTITIES AND REPORT ANY DISCREPANCIES TO THE OFFICER-IN-CHARGE PRIOR TO CONSTRUCTION.
2. FIELD LAYOUT AND MARK TREE AND PALM LOCATIONS AND OBTAIN APPROVAL OF THE OFFICER-IN-CHARGE PRIOR TO EXCAVATING PLANTING PITS.
3. PROVIDE 4" OF PLANTING SOIL OVER ALL PLANTING AREAS.
4. BACKFILL MIX CONSISTS OF FOUR (4) PARTS OF AMENDED IMPORTED PLANTING SOIL TO ONE (1) PART ORGANIC SOIL CONDITIONER (SEE SPECIFICATIONS). ADD ONE (1) POUND OF 10-30-10 FERTILIZER TO ONE (1) CUBIC YARD OF BACKFILL MIX. MIX THOROUGHLY ON PROJECT SITE PRIOR TO ANY PLANTING OPERATIONS.
5. INDICATED BACKFILL MIX IS FOR BIDDING PURPOSES ONLY. A SOIL ANALYSIS WITH RECOMMENDATIONS WILL BE REQUIRED AND TAKE PRECEDENCE OVER THE INDICATED MIXTURE.
6. REFER TO PLANTING DETAILS FOR RECOMMENDED TABLET LOCATION IN PLANTING PIT.
7. SLOW RELEASE FERTILIZER PLANTING TABLETS 20-10-5, 21 GRAM SIZE FOR TREES, PALMS, AND SHRUBS MUST BE AS FOLLOWS:

FIELD SPECIMEN	12 TABLETS
45 GALLON	10 TABLETS
25 GALLON	8 TABLETS
15 GALLON	5 TABLETS
5 GALLON	3 TABLETS
3 GALLON	2 TABLETS
1 GALLON	1 TABLET

8. GROUNDCOVER MUST BE PLANTED UNDER ALL TREES, PALMS, AND SHRUBS (UNLESS OTHERWISE NOTED ON PLANS).
9. PROVIDE 2" MINIMUM DEPTH OF ORGANIC COVER MULCH OVER ALL PLANTED AREAS EXCLUDING TURF (UNLESS OTHERWISE NOTED ON PLANS).
10. THE CONTRACTOR MUST VERIFY THE PLANT QUANTITY ESTIMATES SHOWN ON THE MATERIAL SCHEDULE FOR THE PURPOSES OF BIDDING AND PROCUREMENT. THE CONTRACTOR MUST PROVIDE PLANTS AND OTHER MATERIALS IN THE QUANTITIES NECESSARY TO COMPLETE THE INSTALLATION AS SHOWN ON THE DRAWINGS.
11. UPON SUBSTANTIAL COMPLETION OF THE GENERAL PLANT QUANTITIES, THE CONTRACTOR MUST NOTIFY THE LANDSCAPE ARCHITECT AND SCHEDULE A SITE MEETING TO FIELD DIRECT LOCATIONS OF THE "PLANT MATERIAL FOR INFILL" TO BE INSTALLED BY THE CONTRACTOR PRIOR TO THE COMMENCEMENT OF THE FORMAL MAINTENANCE PERIOD.
12. CONTRACTOR MUST RESTORE ALL EXISTING AREAS DAMAGED BY CONSTRUCTION ACTIVITIES AND TO MATCH ADJACENT AREAS AT NO ADDITIONAL PROJECT COST.
13. AFTER THE COMPLETION OF PLANT INSTALLATION, PROVIDE 1" DEPTH BLACK CINDER TO 'FINISH' AND ACHIEVE A CLEAN PROJECT APPEARANCE OF PLANTER AREAS.

Sheet No. _____ of _____

NOT FOR CONSTRUCTION

STRUCTURAL DESIGN CRITERIA

1. BASIS OF DESIGN: 2018 INTERNATIONAL BUILDING CODE, ASCE 7-16, ACI 318-14

2. LIVE LOAD:

   OFFICE = 50 PSF CLASSROOM = 40 PSF LIGHT STORAGE = 125 PSF
   CORRIDORS = 100 PSF ROOF = 20 PSF STAIRS & EXIT WAYS = 100 PSF LIBRARY = 150 PSF

3. DEAD LOAD: SECOND FLOOR AND ROOF (FOR JOIST DESIGN)

   METAL DECK = 2 PSF MEMBRANE = 1 PSF MECH & ELEC = 3 PSF MISC. = 10 PSF CONCRETE = 51 PSF
   INSULATION = 2 PSF FIRE PROTECTION = 2 PSF

4. WIND FORCE: (ASCE 7-16)

   BASIC WIND SPEED = SEE SCHEDULE THIS SHEET
   EXPOSURE CATEGORY: C
   RISK CATEGORY = SEE SCHEDULE THIS SHEET
   WIND PRESSURE, P = qz GCp - qh (GCpi)
   GUST FACTOR, G = 0.85
   Cp = EXTERNAL PRESSURE COEFFICIENT FROM ASCE 7-16 FIG. 27.3-1 OR 27.3-3
   (GCpi) = INTERNAL PRESSURE COEFFICIENT FROM ASCE 7-16 FIG. 26.13-1
   VELOCITY PRESSURE, qz = 0.00256 Kz Kzt Kd Ke V^2 PSF
   WHERE: TOPOGRAPHIC FACTOR, Kzt = 1.0
   WIND DIRECTIONALITY FACTOR, Kd = 0.85
   GROUND ELEVATION FACTOR, Ke = 1.0
   Kz = VELOCITY PRESSURE EXPOSURE COEFFICIENT FROM ASCE 7-16 TABLE 26.10-1
   qh = THE VELOCITY PRESSURE AT MEAN ROOF HEIGHT

4. SEISMIC FORCE (IBC 2018)

   ECCENTRICITY RATIO = 5%
   RESPONSE MODIFICATION FACTOR, SEE SCHEDULE THIS SHEET
   SEISMIC IMPORTANCE FACTOR = SEE SCHEDULE THIS SHEET
   0.2 SECOND SPECTRAL RESPONSE ACCELERATION (5% OF CRITICAL DAMPING), Ss = 2.82g
   1 SECOND SPECTRAL RESPONSE ACCELERATION (5% OF CRITICAL DAMPING), S1 = 0.698g
   LONG - PERIOD TRANSITION PERIOD = 12 s
   SITE CLASS: C
   RISK CATEGORY: SEE SCHEDULE THIS SHEET
   SEISMIC DESIGN CATEGORY: D
   Sds = 2.26 g
   Sd1 = 0.652 g

5. REINFORCING STEEL:

   UNCOATED DEFORMED BARS: - - - - - - - - - FY = 60,000 PSI

   DEFORMED REINFORCEMENT SHALL COMPLY WITH ASTM A706, GRADE 60, ASTM A615 GRADE 60 REINFORCEMENT SHALL BE PERMITTED IF:
   - THE ACTUAL YIELD STRENGTH BASED ON MILL TESTS DOES NOT EXCEED Fy BY MORE THAN 18,000 PSI; AND;
   - THE RATIO OF THE ACTUAL TENSILE STRENGTH TO THE ACTUAL YIELD STRENGTH IS NOT LESS THAN 1.25.

6. LOAD COMBINATIONS (IBC 2018)

DL = DEAD LOAD	COMBO 1:	1.4 (DL)
FL = FLOOR LOAD	COMBO 2:	1.2 (DL) + 1.6 (FL) + 0.5 (RL)
RL = ROOF LOAD	COMBO 3:	1.2 (DL) + 1.6 (RL) + 0.5 (FL)
WL = WIND LOAD	COMBO 4 THRU 7:	1.2 (DL) + 1.6 (WLX / WLY) + 0.5 (FL) +0.5 (RL)
EQ = EARTHQUAKE LOAD	COMBO 8 THRU 11:	1.2 (DL) + 1.0 (EQX / EQY) + 0.5 (FL)
WR = ROOF WIND LOAD	COMBO 12 THRU 15:	0.9 (DL) + 1.6 (WLX / WLY)
	COMBO 16 THRU 19:	0.9 (DL) + 1.0 (EQX / EQY)

7. CONCRETE COVER:

   TOP OF ROOF SLABS: - 1 1/2"
   BOTTOM OF INTERIOR ROOF SLABS: - 1"
   TOP & BOTTOM OF EXTERIOR ROOF SLABS: - 1 1/2"
   TOP & BOTTOM OF INTERIOR FLOOR SLABS: - 1"
   PRECAST WALL: - 3/4"
   WALLS (SMALLER THAN 10"): - 1 1/2"
   WALLS (10" AND GREATER): - 2"
   WALLS W/ REVEALS (AT REVEAL SIDE ONLY) - REVEAL DEPTH +WALL COVER
   BEAMS (SMALLER THAN 12"): - 1 1/2"
   BEAMS (12" AND GREATER): - 2"
   COLUMNS: - 2"
   FORMED FOOTINGS: - 2"
   WALLS, SLABS AND FOOTING CAST AGAINST EARTH: - - - - - - - - - - - - - - - - - - 3"
   WALLS, SLABS AND FOOTING IN CONTACT WITH FLUIDS: - - - - - - - - - - - - - - - - 2"

8. CONCRETE STRENGTH:

   FOOTING: - f 'c = 4,000 PSI
   SLAB ON GRADE: - f 'c = 4,000 PSI
   CONCRETE TOPPING: - f'c = 4,000 PSI
   COLUMNS, WALLS, BEAMS, SUSPENDED SLABS: - f 'c = 4,000 PSI
   OTHERS: - f 'c = 4,000 PSI

9. ALLOWABLE SOIL BEARING PRESSURES:

DL + LL	DL + LL + EQ or WL
4,000 PSF	5,330 PSF

10. STRUCTURAL STEEL:

    SHAPES and PLATES: - ASTM A36, Fy = 36 KSI
    TUBES and PIPES: - ASTM A 500B, Fy = 46 KSI
    BOLTS: - ASTM A325
    ANCHOR BOLTS: - ASTM A307
    WELDING ELECTRODE: - E70XX

WIND FORCE AND SEISMIC FORCE SCHEDULE

FOUNDATION SUBGRADE PREPARATION AND FOUNDATION NOTES

THE FOLLOWING "STRUCTURAL FOUNDATION SUPPORT AND SUBGRADE PREPARATION NOTES" WERE TAKEN FROM THE GEOTECHNICAL INVESTIGATION REPORT FOR THE "SUBSURFACE SOIL INVESTIGATION NEW SIMON SANCHEZ HIGH SCHOOL, YIGO, GUAM PREPARED BY: GEO-ENGINEERING & TESTING, INC..; DATED: 31 AUGUST 2022.

SUBGRADE IMPROVEMENTS: DURING CONSTRUCTION, THE FOLLOWING STRUCTURAL FOUNDATION SUBGRADE IMPROVEMENTS SHOULD BE MADE, WHICHEVER IS APPLICABLE:

1. WHERE FOUNDATION EXCAVATION EXPOSES MODERATELY HARD TO HARD CORALLINE LIMESTONE ROCK, IT MAY BE STOPPED AFTER REACHING THE DESIGNED FOOTING DEPTH; CLEAN THE ROCK SURFACE AS NEEDED. IF THE EXPOSED ROCK SURFACE IS HARD AND UNEVEN, LEVEL IT WITH LEAN CONCRETE OR SAND-CEMENT MIXTURE HAVING AT LEAST 1500 PSI (POUNDS PER SQUARE INCH) 28-DAY COMPRESSIVE STRENGTH, WITH MINIMUM 1 INCH ABOVE HIGHEST POINT OF THE ROCK SURFACE.

2. IF THE EXPOSED SURFACE IS NATIVE CORALLINE LIMESTONE AND/OR DENSE LIMESTONE SAND/GRAVEL SOIL AND IT CAN BE SCARIFIED, SCARIFY AND LEVEL THE UPPER 4 TO 6 INCHES, MOISTURE CONDITION AS NECESSARY AND COMPACT TO AT LEAST 95 PERCENT OF ITS MOD WITH A UNIFORM, DENSE AND UNYIELDING SURFACE.

3. IN THE EVENT THE EXPOSED FOUNDATION SUBGRADE SURFACE IS VERY WEAK (SOIL-LIKE) CORALLINE LIMESTONE OR CLAYEY SILTY SOIL, IT LOOSE TO MEDIUM DENSE SAND/GRAVEL SHOULD BE EXCAVATED ENTIRELY OR TO A MINIMUM DEPTH TO BE DETERMINED BY THE GEOTECHNICAL ENGINEER DURING CONSTRUCTION. THEREAFTER, SCARIFY THE EXPOSED SURFACE TO APPROXIMATELY 6 INCHES DEEP, MOISTURE CONDITION AS NECESSARY AND COMPACT TO AT LEAST 95 PERCENT OF ITS MOD WITH A DENSE AND UNYIELDING SURFACE. APPROVED LIMESTONE SILTY SAND/GRAVEL BACKFILL SOIL SHOULD BE PLACED IN 8-INCH LOOSE LAYERS, MOISTURE CONDITIONED AS NECESSARY AND COMPACTED TO AT LEAST 95 PERCENT OF ITS MOD WITH A UNIFORM, DENSE AND UNYIELDING SURFACE. NOTE THAT PART OF THE EXCAVATED SOILS MAY BE REUSABLE.

4. HARD ROCK EXCAVATION - IN GENERAL, THE ON-SITE CORALLINE LIMESTONE ROCK WILL BE DIFFICULT TO EXCAVATE AND WILL REQUIRE AN EXCAVATOR WITH VIBRATORY ROCK BREAKER. THE CONTRACTOR SHOULD BE RESPONSIBLE FOR THE EXCAVATIONS AND THE SAFETY OF MEN AND EQUIPMENT WORKING WITH AND AROUND THE EXCAVATIONS.

GENERAL STRUCTURAL NOTES

1. ALL WORK SHALL COMPLY WITH ALL APPLICABLE PROVISIONS AND MINIMUM STANDARDS OF THE 2018 INTERNATIONAL BUILDING CODE (IBC) AND ANY OTHER REGULATING AGENCIES, CODES, AND STANDARDS HAVING AUTHORITY OVER ANY PORTION OF THE WORK.

2. "GENERAL STRUCTURAL NOTES" AND TYPICAL DETAILS SHOWN ON THESE "S0" SHEETS APPLY TO ALL STRUCTURAL DRAWINGS UNLESS NOTED OR SHOWN OTHERWISE.

3. FEATURES OF CONSTRUCTION SHOWN ON THE "S0" SHEETS ARE TYPICAL AND SHALL APPLY GENERALLY THROUGHOUT THE STRUCTURAL DRAWINGS FOR SIMILAR CONDITIONS.

4. REFER TO THE ARCHITECTURAL DRAWINGS FOR BUILDING DIMENSIONS AND LAYOUTS UNLESS NOTED OR SHOWN OTHERWISE ON THESE STRUCTURAL DRAWINGS.

5. THE CONTRACTOR SHALL VERIFY ALL DIMENSIONS AND LAYOUTS BEFORE THE START OF ANY WORK AND SHALL IMMEDIATELY NOTIFY THE CONTRACTING OFFICER (CO) IN WRITING OF ANY DISCREPANCIES THAT MAY AFFECT THE DESIGN INTENT. RESOLUTION OF THE DISCREPANCY MUST BE RECEIVED IN WRITING FROM THE CONTRACTING OFFICER (ARCHITECT/ENGINEER) BEFORE PROCEEDING WITH THE WORK.

6. IF EQUIPMENT IS TO BE HOUSED IN A FACILITY, ROOM OR BUILDING, IT SHALL BE THE RESPONSIBILITY OF THE CONTRACTOR TO CONFIRM WITH THE EQUIPMENT MANUFACTURER AND DESIGNER ENGINEER OF RECORD (EOR) THAT THE INTENDED LAYOUT, ANCHORING, AND DIMENSIONS MEETS THE EQUIPMENT MANUFACTURER'S REQUIREMENTS.

7. REFER TO THE CIVIL "C" DRAWINGS FOR EXTERIOR SLAB ON GRADE (WALKWAY) AND CONCRETE DRIVEWAY DIMENSIONS AND DETAILS.

8. THE CONTRACTOR SHALL COORDINATE AND CONFIRM ALL SLAB ELEVATIONS WITH THE CIVIL "C" DRAWINGS.

9. REFER TO THE ARCHITECTURAL "A" AND MECHANICAL "M" DRAWINGS FOR SLAB DEPRESSIONS AND SLOPES AS REQUIRED FOR VARIOUS FLOOR FINISHES, FLOOR DRAINS, ROOF DRAINS, AND ROOF SLOPES.

10. DO NOT REMOVE SHORING OF CONCRETE MEMBER(S) BEFORE THE CONCRETE HAS ATTAINED THE SPECIFIED CONCRETE COMPRESSIVE STRENGTH.

11. DO NOT IMPOSE LOADS ONTO UNSUPPORTED CONCRETE MEMBER(S) BEFORE THE CONCRETE IN THOSE MEMBER(S) HAS ATTAINED THE SPECIFIED CONCRETE COMPRESSIVE STRENGTH.

12. OPENINGS, NOTCHES, POCKETS, REVEALS AND/OR ETCHINGS, ETC. SHALL NOT BE PLACED IN STRUCTURAL MEMBERS UNLESS SPECIFICALLY DETAILED ON THE STRUCTURAL DRAWINGS. NOTIFY THE CO IN WRITING WHEN WORK REQUIRES THESE ELEMENTS IN THE STRUCTURAL MEMBERS AND ARE NOT SHOWN ON THE STRUCTURAL DRAWINGS. RESOLUTION TO THE DISCREPANCY MUST BE RECEIVED IN WRITING FROM THE CONTRACTING OFFICER (ARCHITECT/ENGINEER)BEFORE PROCEEDING WITH THE WORK.

13. THE PROJECT SPECIFICATIONS FORM A PART OF THE CONTRACT DOCUMENTS.

14. DRAWINGS SHALL NOT BE SCALED.

15. PRIOR TO SUBMITTING SHOP DRAWINGS AND PRODUCT DATA, THE CONTRACTOR SHALL VERIFY THAT THE SUBMITTALS MEET THE REQUIREMENTS OF THE DRAWINGS AND SPECIFICATIONS. THE CONTRACTOR SHALL SPECIFICALLY NOTE ANY EXCEPTIONS TO THESE REQUIREMENTS WITHIN THE SUBMITTALS.

16. WHERE THE WEIGHT OF EQUIPMENT OR MATERIALS BEING STORED OR TRANSPORTED TO LOCATION EXCEEDS THE DESIGN LIVE LOAD OF THE AFFECTED AREAS, THE CONTRACTOR SHALL PROVIDE TEMPORARY SHORING OR OTHER LOAD SPREADING MEANS TO DISTRIBUTE THE STORED OR TRANSPORTED WEIGHT. THE DESIGN OF SUCH TEMPORARY SHORING IS THE SOLE RESPONSIBILITY OF THE CONTRACTOR.

17. THE CONTRACTOR SHALL COORDINATE ALL PENETRATIONS BELOW AND ABOVE GRADE (I.E., PIPE PENETRATIONS, OPENINGS REQUIRED FOR EQUIPMENT, ETC.) THROUGH THE STRUCTURAL SUPPORTING ELEMENTS BETWEEN DISCIPLINES AND SHALL IMMEDIATELY NOTIFY THE CONTRACTING OFFICER (ARCHITECT/ENGINEER) IN WRITING OF ANY DISCREPANCIES AND/OR CONFLICTS THAT MAY AFFECT THE DESIGN INTENT. RESOLUTION TO THE DISCREPANCY MUST BE RECEIVED IN WRITING FROM THE CONTRACTING OFFICER (ARCHITECT/ENGINEER) BEFORE PROCEEDING WITH THE WORK.

    ALL PENETRATIONS, TO INCLUDE PENETRATIONS THROUGH CONCRETE FOUNDATIONS, FOUNDATION WALLS, WALLS AND BEAMS SHALL BE INCLUDED IN THE SHOP DRAWINGS AND SHALL BE SUBJECT FOR REVIEW AND APPROVAL.

    PENETRATIONS THROUGH THE OPEN WEB STEEL JOIST AND JOIST GIRDER SHALL BE PER THE APPROVAL OF THE JOIST OR JOIST GIRDER MANUFACTURER.

    IF A PENETRATION WAS MISSED IN THE SHOP DRAWING AND/OR CONCRETE POUR, THE CONTRACTOR SHALL IMMEDIATELY NOTIFY THE CONTRACTING OFFICER (ARCHITECT/ENGINEER) IN WRITING. THE CONTRACTOR SHALL NOT CORE OR ATTEMPT TO CHIP THE STRUCTURE TO PROVIDE FOR THIS MISSED PENETRATION WITHOUT WRITTEN CONSENT AND APPROVAL FROM THE CONTRACTING OFFICER (ARCHITECT/ENGINEER).

    REFER TO THE RESPECTIVE DISCIPLINE REQUIRING THE PENETRATION FOR EXACT SIZE AND LOCATION OF THE PENETRATION.

    REFER TO "S0" SHEETS FOR TYPICAL PENETRATION DETAILS UNLESS NOTED OTHERWISE.

18. CONCRETE EQUIPMENT PADS (I.E., PADS FOR ELECTRICAL EQUIPMENT, GENERATOR, MECHANICAL EQUIPMENT, A/C EQUIPMENT, ETC.) SHOWN ON THE STRUCTURAL DRAWINGS ARE FOR REFERENCE ONLY UNLESS NOTED OTHERWISE. REFER TO THE RESPECTIVE DISCIPLINE REQUIRING THE EQUIPMENT PAD FOR ITS EXACT SIZE AND LOCATION.

    REFER TO THE "S0" SHEETS FOR TYPICAL EQUIPMENT PAD ON GRADE OR ON SUSPENDED SLAB PAD DETAILS UNLESS NOTED OTHERWISE.

19. PIPE SUPPORTS (I.E. PIPE HANGERS, PIPE CONCRETE SUPPORTS/CRADLES, PIPE STEEL SUPPORT, PIPE RACK FRAME, PIPE CONCRETE ENCASEMENT, ETC.) IF SHOWN ON THESE STRUCTURAL DRAWINGS ARE FOR REFERENCE ONLY UNLESS NOTED OTHERWISE. REFER TO THE RESPECTIVE DISCIPLINE REQUIRING THE PIPE SUPPORTS FOR ITS EXACT SIZE, LOCATION, AND DETAILS UNLESS NOTED OTHERWISE IN THESE STRUCTURAL PLANS.

NOTATION

a = 10% LEAST HORIZONTAL DIMENSION OR 0.4h, WHICHEVER IS SMALLER, BUT NOT LESS THAN EITHER 4% OF LEAST HORIZONTAL DIMENSION OR 3 FEET.

EXCEPTION: FOR BUILDING WITH 0 = 0 DEGREE TO 7 DEGREE AND A LEAST HORIZONTAL DIMENSION GREATER THAN 300 FEET, DIMENSION A SHALL BE LIMITED TO A MAXIMUM OF 0.8h.

h = MEAN ROOF HEIGHT, IN FEET, EXCEPT THAT EAVE HEIGHT SHALL BE USED FOR 0 ≤ 10 DEGREE.
0 = ANGLE OF PLANE OF ROOF FROM HORIZONTAL, IN DEGREES.

12	INSPECT FORMWORK FOR SHAPE, LOCATION AND DIMENSIONS OF THE CONCRETE MEMBER BEING FORMED.	-	X	ACI 318: 26.1 1.1.2(b)	-

SPECIAL STRUCTURAL INSPECTIONS AS PER THE 2018 INTERNATIONAL BUILDING CODE (IBC)

1. SPECIAL INSPECTION AND TESTING SHALL BE PER IBC 2018 CHAPTER 17 TITLE "SPECIAL INSPECTIONS AND TESTING" REQUIREMENTS UNLESS NOTED OTHERWISE.
2. REFER TO SECTION 1704 FOR THE OWNER'S AND CONTRACTOR'S RESPONSIBILITY AND TESTS FOR SPECIAL INSPECTIONS AND FOR ALL WORK NOTED IN THE SPECIAL INSPECTION TABLES (SHOWN ON THIS SHEET).
3. REFER TO SECTION 1704.2.1 FOR SPECIAL INSPECTOR QUALIFICATIONS. PRIOR TO THE START OF THE CONSTRUCTION, THE APPROVED AGENCIES SHALL PROVIDE WRITTEN DOCUMENTATION TO THE BUILDING OFFICIAL DEMONSTRATING THE COMPETENCE AND RELEVANT EXPERIENCE OR TRAINING OF THE SPECIAL INSPECTORS WHO WILL PERFORM THE SPECIAL INSPECTIONS AND TESTS DURING CONSTRUCTION.
4. DUTIES AND RESPONSIBILITIES OF THE SPECIAL INSPECTOR:
   - A. THE SPECIAL INSPECTOR SHALL OBSERVE THE WORK ASSIGNED FOR THE CONFORMANCE WITH THE APPROVED DESIGN DRAWING AND SPECIFICATION. THE INSPECTOR MAY NOT ALTER, MODIFY OR WAVE ANY OF THE REQUIREMENTS OF THE CONTRACT DOCUMENTS.
   - B. THE SPECIAL INSPECTOR SHALL KEEP RECORDS OF INSPECTIONS AND FURNISH INSPECTOR REPORTS TO THE GOVERNMENT/OWNER, THE CONTRACTING OFFICER, THE BUILDING OFFICIAL, THE REGISTERED DESIGN PROFESSIONAL IN RESPONSIBLE CHARGE AND THE CONTRACTOR. ALL DISCREPANCIES SHALL BE BROUGHT TO THE IMMEDIATE ATTENTION OF THE GOVERNMENT/OWNER, THE CONTRACTING OFFICER AND THE CONTRACTOR FOR CORRECTIVE ACTION. IF CORRECTIVE ACTION HAS NOT BEEN TAKEN, THE SPECIAL INSPECTOR SHALL COMPILE AND SUBMIT A LIST OF ALL OUTSTANDING DISCREPANCIES TO THE GOVERNMENT/OWNER, THE CONTRACTING OFFICER, BUILDING OFFICIAL AND THE REGISTERED DESIGN PROFESSIONAL IN RESPONSIBLE CHARGE. THIS SHALL BE DONE ON A WEEKLY BASIS UNTIL ALL CORRECTIVE ACTIONS HAVE BEEN COMPLETED.
   - C. SPECIAL INSPECTOR SHALL SUBMIT A FINAL SIGNED REPORT TO THE GOVERNMENT/OWNER STATING WHETHER THE WORK REQUIRING SPECIAL INSPECTION WAS, TO THE BEST OF THE INSPECTOR'S KNOWLEDGE, IN CONFORMANCE WITH THE APPROVED PLANS AND SPECIFICATIONS AND THE APPLICABLE WORKMANSHIP PROVISIONS OF THE CODE.
5. OBSERVATION INSPECTIONS BY REGISTERED DESIGN PROFESSIONAL IN RESPONSIBLE CHARGE / ENGINEER OF RECORD WILL BE REQUIRED FOR ALL PLACEMENT OF STEEL REINFORCEMENT PRIOR TO CONCRETE POURING FOR THE FOLLOWING:
   - A. CAST-IN-PLACE CONCRETE FOUNDATIONS, GRADE BEAMS, SLAB ON GRADES, WALLS, COLUMNS, BEAMS, HEADER BEAMS, ELEVATED SLABS, CONCRETE TOPPING, ETC.
   - B. PRECAST CONCRETE PANELS (IF REQUIRED).
   - C. PLACEMENT OF PRECAST CONCRETE PANELS AND GROUTING OF WALL PANEL DOWEL CONNECTIONS TO FOUNDATIONS AND PANEL TO PANEL CONNECTIONS. THIS IS TO INCLUDE PANEL TO PANEL ERECTION WELD CONNECTIONS.
   - D. PLACEMENT OF JOIST GIRDERS AND JOIST SEATS.
6. WHERE SPECIAL INSPECTION REQUIREMENTS DUPLICATE THE REQUIREMENTS OF SPECIFIED QUALITY ASSURANCE TESTING, DUPLICATE INSPECTIONS SHALL NOT BE REQUIRED.
7. INSPECTION OF FABRICATORS:
   - A. SPECIAL INSPECTIONS ARE NOT REQUIRED WHERE THE WORK IS DONE ON THE PREMISES OF THE FABRICATOR REGISTERED AND APPROVED TO PERFORM SUCH WORK WITHOUT SPECIAL INSPECTION IN ACCORDANCE WITH SECTION 1704.2.5.
   - B. AT COMPLETION OF FABRICATION, THE APPROVED FABRICATOR SHALL SUBMIT A CERTIFICATE OF COMPLIANCE TO THE BUILDING OFFICIAL STATING THAT THE WORK WAS PERFORMED IN ACCORDANCE WITH THE APPROVED CONSTRUCTION DOCUMENTS.
8. SPECIAL INSPECTIONS SHALL BE REQUIRED FOR ALL CONCRETE CONSTRUCTION WORK LISTED IN THE TABLES (SHOWN ON THIS SHEET) WITH CORRESPONDING FREQUENCY OF INSPECTIONS, THAT APPLY TO THIS PROJECT INCLUDING BUT NOT LIMITED TO THE FOLLOWING:
   - A. SPECIAL INSPECTION FOR WIND RESISTANCE SHALL BE IN ACCORDANCE WITH IBC 2018 SECTION 1705.11.
   - B. SPECIAL INSPECTION FOR SEISMIC RESISTANCE SHALL BE IN ACCORDANCE WITH IBC 2018 SECTION 1705.12.
9. SPECIAL INSPECTION FOR INSPECTION AND TESTING OF STEEL CONSTRUCTION SHALL BE IN ACCORDANCE WITH IBC 2018 SECTION 1705.2 IN CONJUNCTION WITH TABLE 1704.3 (SHOWN ON THIS SHEET) FROM IBC 2009.

TABLE 1705.6 REQUIRED SPECIAL INSPECTIONS AND TESTS OF SOILS

TYPE		CONTINUOUS SPECIAL INSPECTION	PERIODIC SPECIAL INSPECTION
1	VERIFY MATERIALS BELOW SHALLOW FOUNDATIONS ARE ADEQUATE TO ACHEVE THE DESIGN BEARING CAPACITY.	-	X
2	VERIFY EXCAVATIONS ARE EXTENDED TO PROPER DEPTH AND HAVE REACHED PROPER MATERIAL.	-	X
3	PERFORM CLASSIFICATION AND TESTING OF COMPACTED FILL MATERIALS.	-	X
4	VERIFY USE OF PROPER MATERIALS, DENSITIES AND LIFT THICKNESS DURING PLACEMENT AND COMPACTION OF COMPACTED FILL	X	-
5	PRIOR TO PLACEMENT OF COMPACTED FILL, INSPECT SUBGRADE AND VERIFY THAT SITE HAS BEEN PREPARED PROPERLY.	-	X

EMBEDMENT AND LAP NOTES

1. PROVIDE STANDARD ACI 90 DEGREE BEND OR HOOK IF EMBEDMENT LENGTH IS LESS THAN REQUIRED MINIMUM AS SHOWN IN THIS TABLE. REINFORCEMENT IN WALLS, SLAB, BEAMS, ETC. SHALL BE EMBEDDED INTO SUPPORTING OR INTERSECTION STRUCTURAL ELEMENTS.
2. " TOP " ARE DEFINED WHERE HORIZONTAL REINFORCEMENT IS PLACED SUCH THAT MORE THAN 12 INCHES OF FRESH CONCRETE IS CAST BELOW THE DEVELOPMENT LAP OR SPLICE.
3. FOR SLABS, LOCATE LAPS WITHIN THE MIDDLE THIRD OF THE SPANS FOR TOP BARS AND AT SUPPORTS FOR BOTTOM BARS. USE "CLASS A" SPLICE IF LAPS ARE STAGGERED. OTHERWISE USE "CLASS B" SPLICE.
4. FOR WALLS, LOCATE LAPS AS SHOWN ON DETAILS AND USE "CLASS B" SPLICE FOR DOUBLE CURTAIN REINFORCEMENT, STAGGER LOCATION OF LAP FROM ONE CURTAIN TO ANOTHER.
5. FOR BEAMS AND COLUMNS, LOCATE LAPS AS SHOWN IN DETAILS USE "CLASS B" SPLICES UNLESS NOTED OTHERWISE.
6. FOR DEVELOPMENT LENGTH OF INDIVIDUAL BARS WITHIN A BUNDLE, THE DEVELOPMENT LENGTH SHALL BE THAT OF THE INDIVIDUAL BAR, INCREASE 20 PERCENT FOR THE THREE-BAR BUNDLE AND 33 PERCENT FOR THE FOUR BAR BUNDLE.
7. WHEN BARS OF DIFFERENT SIZES ARE USED IN A LAP SPLICE, THE LAP SPLICE LENGTH OF THE BIGGER BAR SHALL BE USED.

ACI 318-14 (SECTION 7.1.3) MINIMUM DEVELOPMENT REQUIREMENTS OF HOOPS AND CROSS TIES

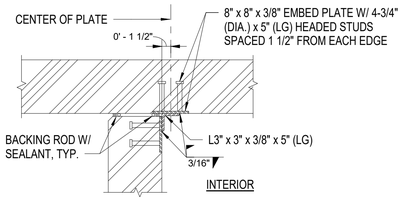
WALL PANEL NOTES



1. REFER TO SHEETS SHOWING PRECAST WALL PANEL ELEVATIONS.
2. IT SHALL BE THE RESPONSIBILITY OF THE CONTRACTOR, IN THE PREPARATION OF THE SHOP DRAWINGS, TO VERIFY WITH THE STEEL JOIST MANUFACTURER THE EXACT LOCATIONS OF EACH STEEL JOIST WALL SEAT OR STEEL JOIST GIRDER WALL POCKET ALONG EACH INDIVIDUAL PANEL.
3. THE PANELS AS SHOWN ON THIS SHEET IS A REPRESENTATION OF A TYPICAL PANEL MODEL. IT SHALL BE THE RESPONSIBILITY OF THE CONTRACTOR, IN THE PREPARATION OF THE SHOP DRAWINGS, TO MAKE THE NECESSARY ADJUSTMENTS TO EACH PANEL TO ENSURE PROPER FIT BETWEEN PANELS. THE ADJUSTMENTS SHALL ACCOUNT FOR THE OFF-SET AND CONNECTION TO THE ADJACENT PANELS AT BOTH ENDS OF THE PANEL. THIS WILL ESTABLISH THE EXACT OVERALL WIDTH FOR EACH INDIVIDUAL PANEL. PANEL HEIGHTS SHALL ACCOUNT FOR THE OFF-SET FROM THE REFERENCED FLOOR AND/OR ROOF TOP ELEVATIONS. THIS WILL ESTABLISH THE EXACT OVERALL HEIGHTS FOR EACH INDIVIDUAL PANEL.
4. THE CONTRACTOR SHALL SUBMIT TO THE ENGINEER OF RECORD, FOR THE REVIEW AND APPROVAL, IT'S METHODOLOGY FOR THE PANEL ERECTION SEQUENCE, PANEL ERECTION CONNECTION SUPPORTS AND PANEL BRACING. SUBMITTAL SHALL INCLUDE CALCULATIONS PREPARED AND SIGNED BY A GUAM REGISTERED PROFESSIONAL ENGINEER. WRITTEN APPROVAL FROM THE ENGINEER OF RECORD MUST BE OBTAINED BY THE CONTRACTOR PRIOR TO THE FABRICATION AND ERECTION OF THE PANELS.
5. PENETRATIONS SHALL BE AVOIDED DIRECTLY BELOW JOIST / JOIST GIRDER FRAMES. FOR PIPE PENETRATIONS WITHIN 3'-0" BELOW CONCRETE ROOF/METAL DECK, LOCATE PENETRATIONS BETWEEN JOIST / JOIST GIRDER FRAMES AT A MINIMUM DISTANCE OF 1'-0" FROM ADJACENT JOIST FRAME. NO RESTRICTIONS SHALL APPLY FOR PENETRATIONS GREATER THAN 3'-0" BELOW CONCRETE ROOF/METAL DECKING. PENETRATIONS SHALL BE 2'-0" (MIN.) FROM PANEL VERTICAL WALL JOINTS. SEE SHEET S0.-.- FOR WALL PENETRATION DETAILS.
6. ALL ERECTION CONNECTION SHALL BE PLACE AT THE INTERIOR WALL FACE, UNLESS NOTED OTHERWISE.

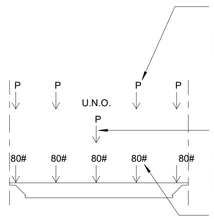
S0.4.6
Sheet No. _____ of _____

NOT FOR CONSTRUCTION

STEEL JOIST GIRDER NOTES

1. JOIST GIRDERS SHALL BE DESIGNED, FABRICATED AND ERECTED IN ACCORDANCE WITH THE LATEST STANDARD SPECIFICATIONS FOR JOIST GIRDERS OF THE STEEL JOIST INSTITUTE (SJI) 45TH EDITION.
2. STEEL JOISTS GIRDERS SHALL BE DESIGNED BY THE MANUFACTURER. THE MANUFACTURER'S ENGINEER SHALL BE RESPONSIBLE FOR THE DESIGN, ADEQUACY AND SAFETY OF ALL STEEL JOIST GIRDERS.
3. EXCEPT WHERE ADDITIONAL DESIGN LOADS ARE SHOWN ON THE STRUCTURAL DRAWINGS, STEEL JOIST GIRDERS SHALL BE DESIGNED AS SIMPLY SUPPORTED PRIMARY MEMBERS WITH ALL LOADS EQUAL IN MAGNITUDE AND EVENLY SPACED ALONG JOIST GIRDER TOP CHORD.
4. ADDITIONAL DESIGN LOADS SHOWN ON THE DRAWINGS SHALL BE CONSIDERED IN THE DESIGN OF THE JOIST GIRDER. WHERE SUCH LOADS DO NOT OCCUR AT THE PANEL POINTS OF THE JOIST GIRDER, AUXILIARY FRAMING SHALL BE ADDED TO THE JOIST GIRDER OR THE TOP CHORD SHALL BE DESIGNED FOR THE EFFECTS OF THE LOAD. WEIGHTS OF MECHANICAL EQUIPMENT ARE NOT INCLUDED IN THE UNIFORM DEAD LOAD. IT IS NECESSARY TO DESIGN THE JOIST GIRDERS FOR ADDITIONAL CONCENTRATED LOAD DUE TO THE WEIGHT OF MECHANICAL EQUIPMENT (ROOF TOP AIR CONDITIONING UNITS, CONCRETE PAD AND SCREEN WALLS).
5. WHEN NET UPLIFT FORCES DUE TO WIND ARE SHOWN ON THE DRAWINGS, THE MANUFACTURER SHALL DESIGN THE JOIST GIRDERS FOR THE NET UPLIFT.
6. JOIST GIRDERS SHALL BE PROPORTIONED SUCH THAT THEY CAN BE ERECTED WITHOUT BRIDGING.
7. MINIMUM BEARING REQUIREMENT, UNLESS NOTED OTHERWISE:
   4" ON STRUCTURAL STEEL, INCLUDING STEEL BEARING SEATS PROJECTING FROM WALLS
   6" ON STEEL BEARING PLATES DIRECTLY OVER CONCRETE WALLS
8. UNLESS NOTED OTHERWISE, JOIST GIRDERS SHALL BE ATTACHED TO SUPPORTING STEEL WORK OR STEEL BEARING PLATES WITH TWO (2) 1/4" FILLET WELDS (ONE EACH SIDE), 3" LONG, OR TWO (2) 3/4" DIAMETER BOLTS.
9. JOIST GIRDERS AT COLUMN CENTERLINES SHALL BE BOLTED TO STRUCTURAL STEEL WITH TWO (2) 3/4" DIAMETER A307 ERECTION BOLTS AND THEN WELDED TO THE COLUMN CAP PLATE UNLESS NOTED OTHERWISE. IF ERECTION BOLTS ARE REMOVED AFTER THE WELDED CONNECTION IS COMPLETE, ADDITIONAL WELDS SHALL BE MADE ALONG THE INSIDE EDGE OF THE SEAT SLOTS. IF A WELDED CONNECTION IS NOT PROVIDED IN THE DETAILS, THEN THE BOLTS SHALL BE A325 AND SHALL REMAIN IN PLACE.
10. NO OTHER LOADS SHALL BE PLACED ON THE JOIST GIRDER UNTIL THE STEEL JOISTS BEARING ON THIS GIRDER ARE IN PLACE AND ATTACHED THERETO.
11. ALL STEEL JOIST GIRDERS SHALL BE CAMBERED IN CONFORMANCE TO THE SJI SPECIFICATIONS. JOISTS LESS THAN 3'-0" FROM WALL SHALL HAVE ZERO CAMBER AND JOISTS BETWEEN 3' AND 6' FROM WALL SHALL HAVE HALF CAMBER OR LESS.
12. ALL ITEMS SUCH AS BUT NOT LIMITED TO, MECHANICAL, ARCHITECTURAL, ELECTRICAL, ETC. THAT REQUIRES EQUIPMENTS THAT ARE TO BE SUPPORTED OR HUNG FROM THE STEEL JOIST GIRDER SHALL BE FRAMED WITH AUXILIARY FRAMING TO THE PANEL POINTS OF THE STEEL JOIST GIRDER. METHODS OF FRAMING THAT INDUCE BENDING TO THE STEEL JOIST GIRDER CHORDS OR WEB MEMBERS MUST BE DESIGNED WITH THE RESPECTIVE LOADS COORDINATED BY THE CONTRACTOR AND JOIST MANUFACTURER.

STEEL JOIST NOTES



1. STEEL JOISTS SHALL BE DESIGNED, FABRICATED AND ERECTED IN ACCORDANCE WITH THE LATEST " STANDARD SPECIFICATIONS FOR OPEN WEB STEEL JOISTS, " LH-SERIES " OF THE STEEL JOIST INSTITUTE (SJI) 45TH EDITION.
2. ALL STEEL JOISTS SHALL BE SPACED AT 4'-0" (MAX.) O.C. UNLESS NOTED OTHERWISE. ALL JOIST SEATS SHALL BE 5" DEEP UNLESS NOTED OTHERWISE.
3. STEEL JOIST DESIGNATIONS GIVE THE TOTAL DEPTH AND SERIES FOLLOWED BY THE TOTAL UNIFORM LOAD (PLF)/UNIFORM LIVE LOAD (PLF). THESE UNIFORM LOADS DO NOT INCLUDE THE EFFECTS OF WIND PRESSURES. BOTH UPLIFT AND DOWN WIND PRESSURES SHALL BE COMBINED AS REQUIRED WITH THESE UNIFORM LOADS. THE JOIST MANUFACTURER SHALL DESIGN THE JOISTS FOR THESE UNIFORM LOADS, AND FOR THE NON-UNIFORM, CONCENTRATED, AND/OR AXIAL LOADS PROVIDED ON THE DRAWINGS. SEE "STRUCTURAL DESIGN CRITERIA" SHEET S0.1.1 AND S0.1.2 FOR DESIGN WIND PRESSURES AND LOAD COMBINATIONS.
4. STEEL JOISTS SHALL BE DESIGNED BY THE MANUFACTURER. THE MANUFACTURER'S ENGINEER SHALL BE RESPONSIBLE FOR THE DESIGN, ADEQUACY AND SAFETY OF ALL STEEL JOISTS.
5. UNLESS OTHERWISE NOTED, STEEL JOISTS SHALL BE DESIGNED AS SIMPLY SUPPORTED, UNIFORMLY LOADED TRUSSES WITH THE TOP CHORD BRACED AGAINST LATERAL BUCKLING. THE UNIFORM DESIGN LOAD SHALL BE THE TOTAL SAFE UNIFORMLY DISTRIBUTED LOAD AS SHOWN IN THE SJI STANDARD LOAD TABLE.
6. WHEN NET UPLIFT FORCES DUE TO WIND ARE SHOWN ON THE DRAWINGS, THE MANUFACTURER SHALL DESIGN THE JOISTS AND BRIDGING FOR THE NET UPLIFT. A SINGLE LINE OF BOTTOM CHORD BRIDGING MUST BE PROVIDED NEAR THE FIRST BOTTOM CHORD PANEL POINTS WHENEVER UPLIFT DUE TO WIND FORCES IS SHOWN ON THE DESIGN DRAWINGS.
7. WHEN NON-UNIFORM OR CONCENTRATED LOADS ARE SHOWN ON THE DRAWINGS, THE MANUFACTURER SHALL DESIGN THE JOISTS IN ACCORDANCE WITH PARAGRAPH 103.1 OF THE "STANDARD SPECIFICATION FOR OPEN WEB STEEL JOIST, 'LH-SERIES"
8. STEEL JOIST BRIDGING SHALL BE PROVIDED IN ACCORDANCE WITH THE SJI SPECIFICATION. ALL BRIDGING AND BRIDGING ANCHORS SHALL BE PLACED AND STEEL JOIST ENDS FIXED PRIOR TO THE APPLICATION OF ANY LOADS. BRIDGING THAT TERMINATES AT, OR IS INTERRUPTED BY, STRUCTURAL STEEL BEAMS, MASONRY WALLS OR CONCRETE WALLS SHALL BE ATTACHED THERETO. COORDINATE BRIDGING LOCATIONS TO AVOID INTERFERENCE WITH ALL MECHANICAL, ELECTRICAL AND FIRE PROTECTION EQUIPMENT.
9. MINIMUM BEARING REQUIREMENTS FOR LH-SERIES STEEL JOISTS, UNLESS NOTED OTHERWISE.
   4" ON STRUCTURAL STEEL, INCLUDING STEEL BEARING SEATS PROJECTING FROM WALLS
   6" ON STEEL BEARING PLATES DIRECTLY OVER MASONRY OR CONCRETE WALLS
10. UNLESS NOTED OTHERWISE, LH-SERIES JOISTS SHALL BE ATTACHED TO SUPPORTING STEEL WORK OR STEEL BEARING PLATES WITH (2) 1/4" FILLET WELDS (ONE EACH SIDE) 2" LONG, OR WITH (2) 3/4" DIAMETER BOLTS (ONE EACH SIDE). WHERE THE DRAWINGS INDICATE THAT THE JOIST SEAT IS TO BE WELDED TO THE SUPPORTING STEEL OR JOIST GIRDER, THE BOLTS PROVIDED ARE FOR ERECTION ONLY. ERECTION BOLTS MAY BE REMOVED AFTER THE WELDS ARE COMPLETED BUT AN ADDITIONAL WELD SHALL BE MADE ALONG THE INSIDE EDGE OF THE SEAT SLOTS.
11. UNLESS NOTED OTHERWISE, STEEL JOISTS AT COLUMN CENTER LINES SHALL BE BOLTED TO STRUCTURAL STEEL WITH (2) 1/2" DIAMETER BOLTS OR (2) 3/4" DIAMETER BOLTS FOR LH-SERIES. WHERE STEEL JOISTS DO NOT SPACE TO COLUMN CENTER LINES, USE BOLTED CONNECTIONS FOR THE STEEL JOIST CLOSEST TO THE CENTER LINE. WHERE THE DRAWINGS INDICATE THAT THE JOIST SEAT IS TO BE WELDED TO THE SUPPORTING STEEL OR JOIST GIRDER, THE BOLTS PROVIDED ARE FOR ERECTION ONLY. ERECTION BOLTS MAY BE REMOVED AFTER THE WELDS ARE COMPLETED BUT AN ADDITIONAL WELD SHALL BE MADE ALONG THE INSIDE EDGE OF THE SEAT SLOTS.
12. HOLES IN STEEL JOIST CHORDS WILL NOT BE PERMITTED, EXCEPT FOR BOLTED CONNECTIONS AT THE BEARING END OF THE STEEL JOIST.
13. ALL ITEMS SUCH AS BUT NOT LIMITED TO, MECHANICAL, ARCHITECTURAL, ELECTRICAL, ETC. THAT REQUIRES EQUIPMENTS THAT ARE TO BE SUPPORTED OR HUNG FROM THE STEEL JOIST SHALL BE FRAMED WITH AUXILIARY FRAMING TO THE PANEL POINTS OF THE STEEL JOIST. METHODS OF FRAMING THAT INDUCE BENDING TO THE STEEL JOIST CHORDS OR WEB MEMBERS MUST BE DESIGNED WITH THE RESPECTIVE LOADS COORDINATED BY THE CONTRACTOR AND JOIST MANUFACTURER.
14. ALL STEEL JOISTS SHALL BE CAMBERED IN CONFORMANCE TO THE SJI SPECIFICATIONS. JOISTS LESS THAN 3'-0" FROM WALL SHALL HAVE ZERO CAMBER AND JOISTS BETWEEN 3' AND 6' FROM WALL SHALL HAVE HALF CAMBER OR LESS.
15. PLACEMENT OF SPRINKLER CONTRACTOR'S PIPING AND STEEL CONTRACTOR'S JOIST BRIDGING SHALL BE COORDINATED BY THE GENERAL CONTRACTOR. THE CONTRACTOR SHALL MAKE PROVISIONS FOR THE STEEL ERECTOR TO ADJUST/RELOCATE BRIDGING OR SPRINKLER CONTRACTOR TO ADJUST OR RELOCATE PIPING WHERE CONFLICTS OCCUR. ALL CHANGES REQUIRED OF THE JOIST BRIDGING SHALL BE DESIGNED BY JOIST MANUFACTURER.

STEEL DECK NOTES

1. STEEL DECK SHALL COMPLY WITH THE REQUIREMENTS OF THE STEEL DECK INSTITUTE "SPECIFICATIONS AND COMMENTARY FOR STEEL ROOF DECK" (2013).
2. STEEL DECK SHALL BE CONFIGURATION, DEPTH AND MINIMUM GAUGE AS SHOWN ON THE DRAWINGS. ATTACHMENT TO THE SUPPORTING STRUCTURE SHALL BE AS SHOWN ON THE DRAWINGS.
3. DO NOT HANG OR SUPPORT ANY LOADS FROM STEEL DECK.
4. STEEL DECK SHALL BE CONTINUOUS OVER A MINIMUM OF THREE SPANS. DECK WITH A THICKNESS OF 18G OR LESS SHALL BE CONTINUOUS FOR A MINIMUM OF TWO SPANS ADJACENT TO JOIST BAYS WITH OPENINGS.
5. DECK ENDS SHALL BE LAPPED A MINIMUM OF 2". BUTTED ENDS ARE NOT PERMITTED.
6. SECURE DECK WITH HILTI X-EDN19 (OR APPROVED EQUAL) DECK PIN FASTENERS @ EACH RIB TO FRAME.
7. GALVANIZED G90.

FIRE SPRINKLER NOTES

1. SPRINKLER PIPING 4" AND SMALLER IN SIZE IS SUSPENDED FROM JOIST TOP CHORDS WITH TOP CHORD HANGERS OFF ONE SIDE OF THE JOIST. PROPORTION JOIST TOP CHORDS FOR THE ECCENTRIC LOADING. THE JOIST UNIFORM DEAD LOADS INCLUDE 9 PLF. FOR SPRINKLER PIPING 2 1/2" AND SMALLER. DEAD LOAD OF SPRINKLER PIPING 3" AND LARGER MUST BE ADDED AS SHOWN IN THE DIAGRAM BELOW IN COORDINATION WITH THE SPRINKLER DRAWINGS. HANGERS FOR ALL SPRINKLER PIPE 3" AND LARGER MUST BE LOCATED WITHIN 6 INCHES OF A JOIST PANEL POINT. CONTRACTOR TO PROVIDE ADDITIONAL WEB STRUT MEMBER(S) IN THE FIELD IF THIS CRITERIA IS NOT MET PER THE JOIST MANUFACTURER'S RECOMMENDATION.).
2. A TEMPORARY LIVE LOAD OF 250# SHALL BE CONSIDERED AT EACH HANGER LOCATION. THIS TEMPORARY LIVE LOAD OCCURS ONLY AT ONE HANGER AT A TIME AND DOES NOT NEED TO BE CONSIDERED IN COMBINATION WITH ANY OTHER LIVE OR SHORT TERM LOADS.
3. ADDITIONAL LOADINGS SHALL BE CONSIDERED IN THE JOIST AND GIRDER DESIGN TO ACCOUNT FOR ROOF MOUNTED AIR CONDITIONING SYSTEM, AND CONCRETE CURB/PAD OR RUNNERS, SEE SHEET S005. SEE MECHANICAL DRAWINGS FOR LOCATION OF AC UNITS AND WEIGHTS. CONTRACTOR TO PROVIDE LOAD STRUTS AS REQUIRED PER THE JOIST MANUFACTURER'S RECOMMENDATION.
4. ADDITIONALLY, THE JOIST MANUFACTURER SHALL ACCOUNT FOR LATERAL & VERTICAL SEISMIC FORCES FROM THE FIRE SPRINKLER SWAY BRACES (WHEN USED). SEE SPRINKLER DRAWINGS FOR LOCATIONS & INTENSITIES.

CONCENTRATED DEAD LOAD FOR MAINS 3" AND LARGER THAT ARE PARALLEL TO JOIST. SEE SPRINKLER DRAWINGS FOR LAYOUT OF MAINS. SEE TABLE BELOW FOR THE UNIFORM DEAD LOAD TO BE ADDED TO THE JOIST DESIGNATION. MAINS 6" AND LARGER ARE SUPPORTED BY TRAPEZE WITH THE TRAPEZE ENDS HUNG CONCENTRICALLY FROM THE ADJACENT JOISTS. BOTH JOISTS SHALL RECEIVE THE ADDED LOADING.

CONCENTRATED DEAD LOAD FOR MAINS 3" AND LARGER THAT ARE TRANSVERSE TO JOIST. APPLY TO JOISTS WHERE THEY CROSS THE MAINS, SEE SPRINKLER DRAWINGS FOR LAYOUT. SEE TABLE BELOW FOR CONCENTRATED DEAD LOAD. MAINS 3" AND LARGER SHALL BE HUNG FROM JOISTS AT A SPACING NOT TO EXCEED 7'-0" O.C.

CONCENTRATED DEAD LOAD FROM SPRINKLER PIPE 2 1/2" AND SMALLER. COLLECTIVE WEIGHT INCLUDED IN JOIST UNIFORM DEAD LOAD. LOCATE HANGERS A MINIMUM OF 2' AWAY FROM HANGERS SUPPORTING MAINS.

STANDARD JOIST LOADS FROM SPRINKLER HANGERS
(BASE ON DYNAFLOW PIPE FOR 4" AND SMALLER, SCH. 10 PIPE FOR 6" AND LARGER - PER SPRINKLER DESIGNER)

MAIN UNIT		MAIN - TRANSVERSE	MAIN - PARALLEL	
SIZE	WEIGHT	CONCENTRATED DEAD LOAD, P	CONCENTRATED DEAD LOAD, P	UNIFORM DEAD LOAD
3"	8 PLF	60#	80# (10'-0" O.C.)	13 PLF
4"	11 PLF	80#	80# (7'-3" O.C. MAX)	15 PLF

Title
CLASSROOMS:
A - WING (WEST)
PRECAST PANEL ELEVATIONS
PROGRAMMING DOCUMENT

Designed:	TPC/CDC
Drawn	AGC
Checked	TPC/CDC
Supv:	TPC
Scale:	1/8" = 1'-0"
Date:	03/31/25
Project File	

Drawing
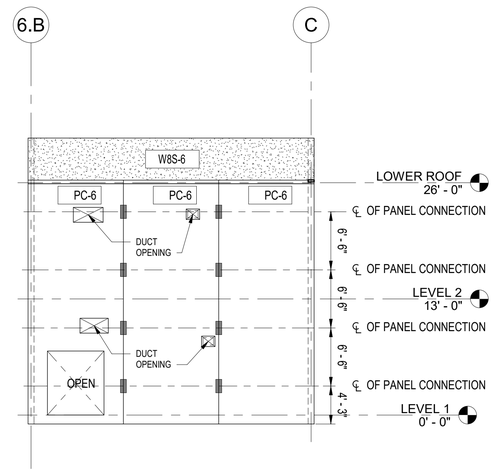
S6.4.5
Sheet No. ____ of ____

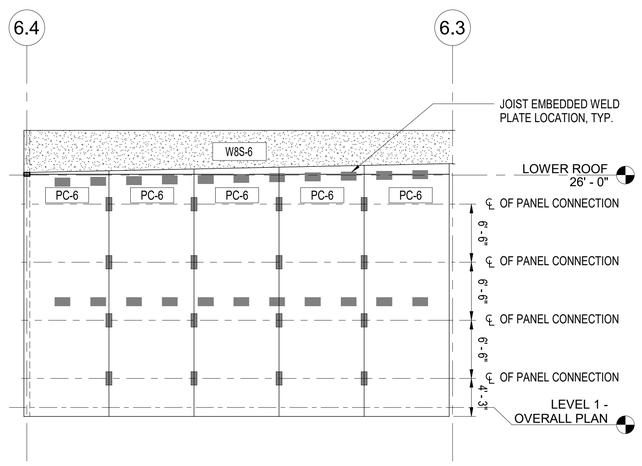


NOT FOR CONSTRUCTION

1 WALL PANEL ASSEMBLY ALONG GRIDLINE 6.B

1/8" = 1'-0"

0' 2' 4' 8' 16'

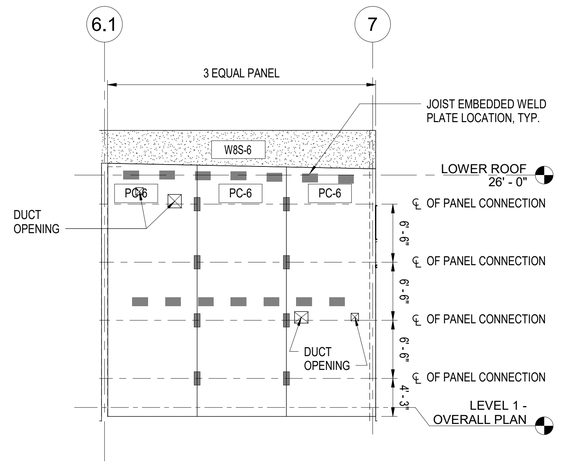


2 WALL PANEL ASSEMBLY ALONG GRIDLINE 6.4

1/8" = 1'-0"

0' 2' 4' 8' 16'

NOTE:



1.0 REFER TO S0.4 SERIES FOR PANEL SCHEDULES, DETAILS, & TYPICAL PANEL TYPE ELEVATION.

3 WALL PANEL ASSEMBLY ALONG GRIDLINE C

1/8" = 1'-0"

0' 2' 4' 8' 16'

4 WALL PANEL ASSEMBLY ALONG GRIDLINE C

1/8" = 1'-0"

0' 2' 4' 8' 16'

IF SHEET IS LESS THAN 24" X 36" REDUCED PRINT – USE GRAPHIC SCALES

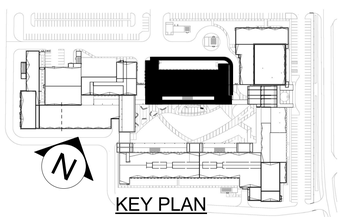
Sheet No. _____ of _____



NOT FOR CONSTRUCTION

MECHANICAL LEGEND AND ABBREVIATIONS

SYMBOL	ABBR	DESCRIPTION	SYMBOL	ABBR	DESCRIPTION	SYMBOL	ABBR	DESCRIPTION
ACDP	ACDP	A/C CONDENSATE PUMP		COND	CONDENSER		NIC	NOT IN CONTRACT
AC	AC	AIR CURTAIN		CON'T	CONTINUATION/CONTINUED		NTS	NOT TO SCALE
ACCU	ACCU	AIR-COOLED CONDENSING UNIT		CW	COLD WATER		O.C.	ON CENTER
AHU	AHU	AIR HANDLING UNIT		DB	DRY BULB		OA	OUTSIDE AIR
CEF	CEF	CEILING EXHAUST FAN		DL	DOOR LOUVER		OAD	OUTSIDE AIR DUCT
DOAS	DOAS	DEDICATED OUTSIDE AIR SYSTEM		DU	DOOR UNDER-CUT		OD	OUTSIDE DIAMETER
EF	EF	EXHAUST FAN		EAD	EXHAUST AIR DUCT		PD	PRESSURE DROP
FCU	FCU	FAN COIL UNIT		EAT	ENTERING AIR TEMPERATURE		PH	PHASE
KEF	KEF	KITCHEN EXHAUST FAN		ELEC	ELECTRICAL		RAD	RETURN AIR DUCT
SF	SF	SUPPLY FAN		EAR	EXHAUST AIR REGISTER		RPM	REVOLUTIONS PER MINUTE
FD	F.D.	FIRE DAMPER		EVAP	EVAPORATOR		RAR	RETURN AIR REGISTER
	VD	VOLUME DAMPER		EWT	ENTERING WATER TEMPERATURE		RL	REFRIGERANT LIQUID LINE
SD		DUCT SMOKE DETECTOR		ESP	EXTERNAL STATIC PRESSURE		RLA	RATED LOAD AMPS
T		PROGRAMMABLE THERMOSTAT MOUNTED 60" AFFL.		EXT	EXTERNAL		RS	REFRIGERANT SUCTION LINE
OA		OUTSIDE AIR CONDITIONS TEMP/HUMIDITY SENSOR		FAD	FRESH AIR DUCT		SA	SUPPLY AIR
		NEW DUCT (SAD, OAD, EAD, RAD)		FLA	FULL LOAD AMPERE		SAD	SUPPLY AIR DUCT
		SUPPLY OUTLET (SIZE - TYPE - CFM)		FLEX	FLEXIBLE		SAR	SUPPLY AIR REGISTER
		RETURN OR EXHAUST INLET (SIZE - TYPE - CFM)		FT	FEET		SHTML	SHEET METAL
	°F	DEGREES FAHRENHEIT		GA	GAGE OR GAUGE		SPECS	SPECIFICATIONS
	Ø	DIAMETER		GAL	GALLONS		SP	STATIC PRESSURE
	AP	ACCESS PANEL		GALV	GALVANIZED		SSTL	STAINLESS STEEL
	ACD	AIR CONDITIONING DRAIN		GPM	GALLONS PER MINUTE		SW	SWITCH
	AMP	AMPERE/AMPERES		HP	HORSEPOWER		TEMP	TEMPERATURE
	ANSI	AMERICAN NATIONAL STANDARDS INSTITUTE		HZ	HERTZ		TSP	TOTAL STATIC PRESSURE
	APPROX	APPROXIMATE		IFM	INDOOR FAN MOTOR		THK	THICK(NESS)
	ASHRAE	AMERICAN SOCIETY OF HEATING, REFRIGERATING AND AIR CONDITINING ENGINEERS		IN	INCHES		TV	TURNING VANE
	ASTM	AMERICAN SOCIETY OF TESTING AND MATERIALS		KW	KILOWATT		TYP	TYPICAL
	AVG	AVERAGE		LBS	POUNDS		UL	UNDERWRITERS LABORATORIES, INC.
	BDD	BACKDRAFT DAMPER		LD	LINEAR DIFFUSER		V	VOLTAGE/VOLTS
	BTU	BRITISH THERMAL UNIT		LVG	LEAVING		VAV	VARIABLE AIR VOLUME
	CAP	CAPACITY		LWT	LEAVING WATER TEMPERATURE		VD	VOLUME DAMPER
	CD	CEILING DIFFUSER		MAD	MAKE-UP AIR DUCT		VRV	VARIABLE REFRIGERANT VOLUME
	CFM	CUBIC FEET PER MINUTE		MD	MODULATING DAMPER		WB	WET BULB
	CO	CLEANOUT		MCA	MINIMUM CIRCUIT AMPACITY		WT	WEIGHT
	COMP	COMPRESSOR		MOCP	MAXIMUM OVER CURRENT PROTECTION			
	CONC	CONCRETE		MISC	MISCELLANEOUS

OIL WATER SEPARATOR

MARK NO.	AREA SERVED	NOMINAL VOLUME (GALLONS)	NOMINAL DIAMETER (FT)	DOUBLE WALL TANK LENGTH (FT)	INLET/OUTLET NOZZLE SIZE (INCHES)	FLOW RATE (GPM)	OIL STORAGE CAPACITY (GAL)	OIL SPILL CAPACITY (GAL)	DOUBLE WALL TANK WEIGHT (LBS)	REMARKS
OWS E1	AUTOMOTIVE WORKSHOP C113	550	4	9'-9"	4	55	110	440	900	

COMPRESSED AIR SYSTEM
SEQUENCE OF OPERATION:

1. CHECK OIL LEVEL. OIL SHOULD BE HALF UP, OR AT THE BOTTOM OF THE THREADS ON THE FILL SPOUT, OR 1/2 FULL IN THE SIGHT GLASS.
2. AT STARTUP, NORMALLY CLOSED INLET VALVE REMAINS CLOSED WHILE THE AIR COMPRESSOR BUILDS UP PRESSURE BY MEANS OF A BYPASS LINE. AFTER STARTUP, THE INLET VALVE IS CONTROLLED BY A SIMPLE ON/OFF ACTION OF A PRESSURE SWITCH AT THE MINIMUM AND MAXIMUM DESIRED AIR RECEIVER PRESSURE.
3. INLET AIR PASSES THRU AIR FILTER AND ENTERS THE COMPRESSOR. DURING COMPRESSION CYCLE, OIL IS INJECTED INTO THE COMPRESSOR. AS COMPRESSED AIR LEAVES THE COMPRESSOR AT THE DISCHARGE END, IT GOES THROUGH A MINIMUM PRESSURE VALVE SET TO MAINTAIN AT LEAST 85 PSIG IN THE SUMP WHEN THE COMPRESSOR IS RUNNING. THE VALVE ACTS AS CHECK VALVE TO PREVENT BACK FLOW INTO THE COMPRESSOR.
4. THE OIL COOLS THE INTERNAL OF THE COMPRESSOR AND PICKS UP THE HEAT GENERATED BY THE COMPRESSION PROCESS. THE OIL MUST BE COOLED IN THE OIL COOLER TO WITHIN 60°F OF THE AMBIENT TEMPERATURE.
5. AFTER OPERATION, TURN OFF THE POWER TO THE COMPRESSOR AND DRAIN ALL THE MOISTURE FROM THE BOTTOM OF THE TANK.
6. AIR/OIL SEPARATOR SHOULD BE CHANGED EVERY 2000 HOURS, OR WHEN THERE IS EXCESSIVE OIL VAPOR IN THE DISCHARGE AIR.

GENERAL NOTES AND SPECIFICATIONS

1. ALL ELECTRICAL WORK SHALL BE IN ACCORDANCE WITH THE APPLICABLE SECTIONS OF THE NATIONAL ELECTRICAL CODE (NEC), 2023 EDITION; RULES AND REGULATIONS OF THE DEPARTMENT OF PUBLIC WORKS, AND GOVERNMENT OF GUAM.
2. ALL EQUIPMENT AND MATERIALS SHALL BE UL LISTED WHERE LISTING IS AVAILABLE FOR THAT TYPE OF EQUIPMENT OR CONFORM TO ANSI OR NEMA STANDARDS. SUBMIT SHOP DRAWINGS AND PRODUCT INFORMATION CATALOG FOR APPROVAL.
3. WORKMANSHIP SHALL CONFORM TO CONSTRUCTION PRACTICES RECOMMENDED BY THE AMERICAN ELECTRICIANS HANDBOOK BY CROFT (LATEST EDITION) AND SHALL BE SUBJECT TO THE APPROVAL OF THE AGENCY WHO HAS JURISDICTION AND THE ENGINEER.
4. ANY DEVICE MAY BE RELOCATED FROM THE LOCATION SHOWN ON DRAWINGS PRIOR TO INSTALLATION AT THE DIRECTION OF THE ENGINEER AND AT NO ADDITIONAL COST TO THE GOVERNMENT.
5. METALLIC ENCLOSURES, RACEWAYS, AND ELECTRICAL EQUIPMENT SHALL BE GROUNDED IN ACCORDANCE WITH REQUIREMENTS OF NEC ARTICLE 250. PROVIDE GROUND WIRE IN EVERY RACEWAY. SIZE IN ACCORDANCE WITH NEC TABLE.
6. CONDUIT SHALL BE PVC (ENCASED IN CONCRETE AND BELOW GRADE), ALUMINUM (EXPOSED INSTALLATION), EMT (DRY LOCATIONS, CONCEALED ABOVE GRADE). 3/4" MINIMUM DIAMETER UNLESS OTHERWISE NOTED.
7. TEST: TESTING IN PRESENCE OF ENGINEER. RESULTS SUBMITTED FOR APPROVAL TO ENGINEER.
   A. MEASUREMENT OF VOLTAGES AT SERVICE EQUIPMENT.
   B. OPERATION TEST.
   C. INSULATION RESISTANCE.
   D. GROUNDING TEST.
8. ELECTRICAL WORK SHALL BE UNDER FULL SUPERVISION OF A PROFESSIONAL ELECTRICAL ENGINEER OR A MASTER ELECTRICIAN REGISTERED TO PRACTICE IN GUAM. SUBMIT QUALIFICATIONS PRIOR TO START OF ANY WORK REVIEW AND APPROVAL.
9. INSTALLATION AND WORKMANSHIP:
   A. ALL WORK SHALL BE NEATLY EXECUTED, WORKMANLIKE IN APPEARANCE, SYMMETRICAL, PLUMB, UNIFORM, PROPERLY ALIGNED AND SECURED IN PLACE.
   B. WIRING METHODS:
      (1) USE SEALTITE FLEX FOR CONNECTION TO EQUIPMENT.
      (2) ATTACH TO CONCRETE AND MASONRY WITH EXPANSION ANCHORS AND TO WOOD WITH WOOD SCREWS.
      (3) SUPPORT RACEWAYS PER NEC.
      (4) DO NOT SUPPORT RACEWAYS AND BOXES FROM AND ON MECHANICAL SYSTEMS.
      (5) CABLES WILL NOT BE PERMITTED.
   C. CONDUCTORS:
      (1) MAKE SPLICES IN ACCESSIBLE LOCATIONS. MAKE SPLICES IN CONDUCTORS No. 10 AWG & SMALLER DIAMETER WITH INSULATED, PRESSURE-TYPE CONNECTOR. MAKE SPLICES IN CONDUCTORS No.8 AWG AND LARGER DIAMETER WITH SOLDERLESS CONNECTOR, AND COVER WITH INSULATION MATERIAL EQUIVALENT TO CONDUCTOR INSULATION.
      (2) FORM WIRE NEATLY IN ENCLOSURES.
      (3) IDENTIFY CONDUCTORS BY COLOR CODE – NEUTRAL WIRE TO BE WHITE AND GROUND WIRE TO BE GREEN.
   D. CUT, DRILL AND PATCH AS REQUIRED. REPAIR ANY SURFACES DAMAGED OR MARRED. CUTTING, REPAIRS AND REFINISHING SHALL BE SUBJECT TO THE APPROVAL OF THE ARCHITECT.
   E. CLEAN ALL SURFACES TO RECEIVE PAINT. PAINT ANY SURFACE DAMAGED DURING INSTALLATION.
   F. REPAIR ALL SURFACES DAMAGED DURING THE INSTALLATION OF THE WORK SUBJECT TO THE APPROVAL OF THE ARCHITECT.
   G. ALL PENETRATIONS THROUGH FIRE RATED WALLS SHALL BE SEALED WITH APPROVED FIRESTOPPING MATERIAL.
   H. PROVIDE EXPANSION/DEFLECTION FITTING FOR CONDUITS PASSING THROUGH SEISMIC JOINTS.
   I. PROVIDE CONDUIT SEAL FOR CONDUITS PASSING THROUGH AIR CONDITIONED AND NON-AIR CONDITIONED AREAS.
   J. SUPPORTING STRUCTURES SHALL BE IN ACCORDANCE WITH SEISMIC ZONE 4 REQUIREMENTS.
10. AT THE CONCLUSION OF THE WORK, THE CONTRACTOR SHALL INCORPORATE ALL CHANGES MADE, AND RECORDED, INTO THE SET OF REPRODUCIBLES IN A CLEAR, LEGIBLE AND REPRODUCIBLE MANNER. ALL STUB-OUTS SHALL BE DIMENSIONALLY LOCATED WITHIN THE BUILDING STRUCTURE. AS A CONDITION FOR ACCEPTANCE OF WORK, "AS-BUILT" REPRODUCIBLE SHALL BE SIGNED BY CONTRACTOR ATTESTING THAT ALL CHANGES HAVE BEEN INCORPORATED, DATED AND DELIVERED TO THE CONTRACTING OFFICER.
11. THE CONTRACTOR SHALL DETERMINE AND VERIFY LOCATION OF EXISTING UTILITIES PRIOR TO START OF WORK. OBTAIN WORK CLEARANCES FROM USING AGENCIES PRIOR TO ANY EXCAVATION/TRENCHING WORK. DAMAGE TO EXISTING UTILITIES SHALL BE REPAIRED OR REPLACED AT NO ADDITIONAL COST TO THE GOVERNMENT.
12. EQUIPMENT POWER POINT OF CONNECTIONS ARE APPROXIMATE. COORDINATE EXACT REQUIREMENT WITH SUPPLIED EQUIPMENT.
13. PROVIDE PULLBOX(ES)/HANDHOLES AS REQUIRED TO MEET NEC PULLING REQUIREMENTS.
14. WHERE CONDUIT CROSSES BUILDING EXPANSION JOINTS, PROVIDE SUITABLE WATERTIGHT EXPANSION FITTING THAT MAINTAIN CONDUIT ELECTRICAL CONTINUITY BY BONDING JUMPERS, OR DEFLECTION COUPLINGS THAT PROTECT CONDUIT WIRING SYSTEM FROM DAMAGE CAUSE BY MOVEMENT WITHOUT ADDITIONAL COST TO THE GOVERNMENT. FURNISH SHOP DRAWING FOR REVIEW AND APPROVAL.
15. CONTRACTOR SHALL COORDINATE WORK WITH GUAM POWER AUTHORITY, GPA.
   a) COORDINATE WITH GPA ENGINEERING 48 HOURS IN ADVANCE FOR INSPECTION OF HANDHOLE, CONDUIT INSTALLATION, TRANSFORMER PAD AND CONDUIT/DUCT MANDRELLING.
   b) OWNER SHALL GRANT A UTILITY EASEMENT TO GPA FOR POWER LINE AND HANDHOLE PRIOR TO FINAL CONNECTION. CONTRACTOR SHALL COORDINATE AND PREPARE THE REQUIRED PAPER WORKS FOR THE GOVERNMENT.
   c) APPLICATION FOR POWER SERVICE MUST BE SUBMITTED 8 MONTHS IN ADVANCE BEFORE FINAL CONNECTION/ENERGIZATION TO ALLOW FOR DELIVERY OF GPA MATERIALS AND EQUIPMENT.
   d) ALL CONDUITS MUST BE CLEANED AND MANDRELLED IN THE PRESENCE OF A GPA INSPECTOR. ALL CONDUITS MUST BE PROVIDED WITH NYLON PULL ROPE OF 200 LBS. MINIMUM PULL STRENGTH.
   e) ALL GPA CONDUITS/DUCTS, BENDS AND ELBOWS SHALL BE CONCRETE ENCASED THROUGHOUT THE WHOLE ROUTE.
   f) CONTRACTOR SHALL OBTAIN A REGISTERED LAND SURVEYOR TO PROVIDE NEW POLE STAKEOUT AND DOWN-GUY LOCATIONS. COORDINATE WITH GPA ENGINEERING FOR SPECIFIC REQUIREMENTS.
   g) CONTRACTOR SHALL OBTAIN A REGISTERED LAND SURVEYOR TO PREPARE EASEMENT EXHIBITS FOR GPA POLES, HANDHOLES, TRANSFORMERS, OVERHEAD/UNDERGROUND POWER LINES AND OTHER ASSOCIATED POWER FACILITIES. COORDINATE WITH GPA ENGINEERING FOR SPECIFIC REQUIREMENTS.
   h) ALL SURVEY STAKEOUTS, MAPS, AND EASEMENT DOCUMENTS SHALL BE FIELD VERIFIED BY GPA.
   i) SHOULD ARCHAEOLOGICAL MONITORING AND MITIGATION BE REQUIRED BY THE DEPARTMENT OF PARKS AND RECREATION STATE HISTORIC PRESERVATION OFFICE (SHPO), THE GOVERNMENT SHALL BE RESPONSIBLE FOR OBTAINING AN ARCHAEOLOGIST TO PERFORM MONITORING AND MITIGATION SERVICES SATISFACTORY TO SHPO. ALL COST FOR SUCH SERVICES SHALL BE THE RESPONSIBILITY OF THE GOVERNMENT.

ELECTRICAL SYMBOL LIST

	LIGHT, LED, CEILING RECESS MOUNTED WITH J-BOX AND FLEXIBLE CONDUIT CONNECTION
/	LIGHT, CEILING SURFACE MOUNTED SHADE INDICATES WITH INTEGRAL BATTERY PACK
/	LIGHT, WALL MOUNTED, SHADE INDICATES WITH INTEGRAL BATTERY PACK
	LIGHT, OPEN STRIP, CEILING PENDANT MOUNTED
	LIGHT, WALL / CEILING MOUNTED, SHADE INDICATES WITH INTEGRAL BATTERY PACK
	LIGHT, CEILING SURFACE MOUNTED, SHADE INDICATES WITH INTEGRAL BATTERY PACK
	LIGHT, CEILING RECESS MOUNTED, SHADE INDICATES WITH INTEGRAL BATTERY PACK
/	LIGHT, LED, CONNECTED TO GENERATOR POWER, CEILING RECESS MOUNTED WITH J-BOX AND FLEXIBLE CONDUIT CONNECTION
	LIGHT, CONNECTED TO GENERATOR POWER, CEILING SURFACE MOUNTED.
	LIGHT, WALL MOUNTED

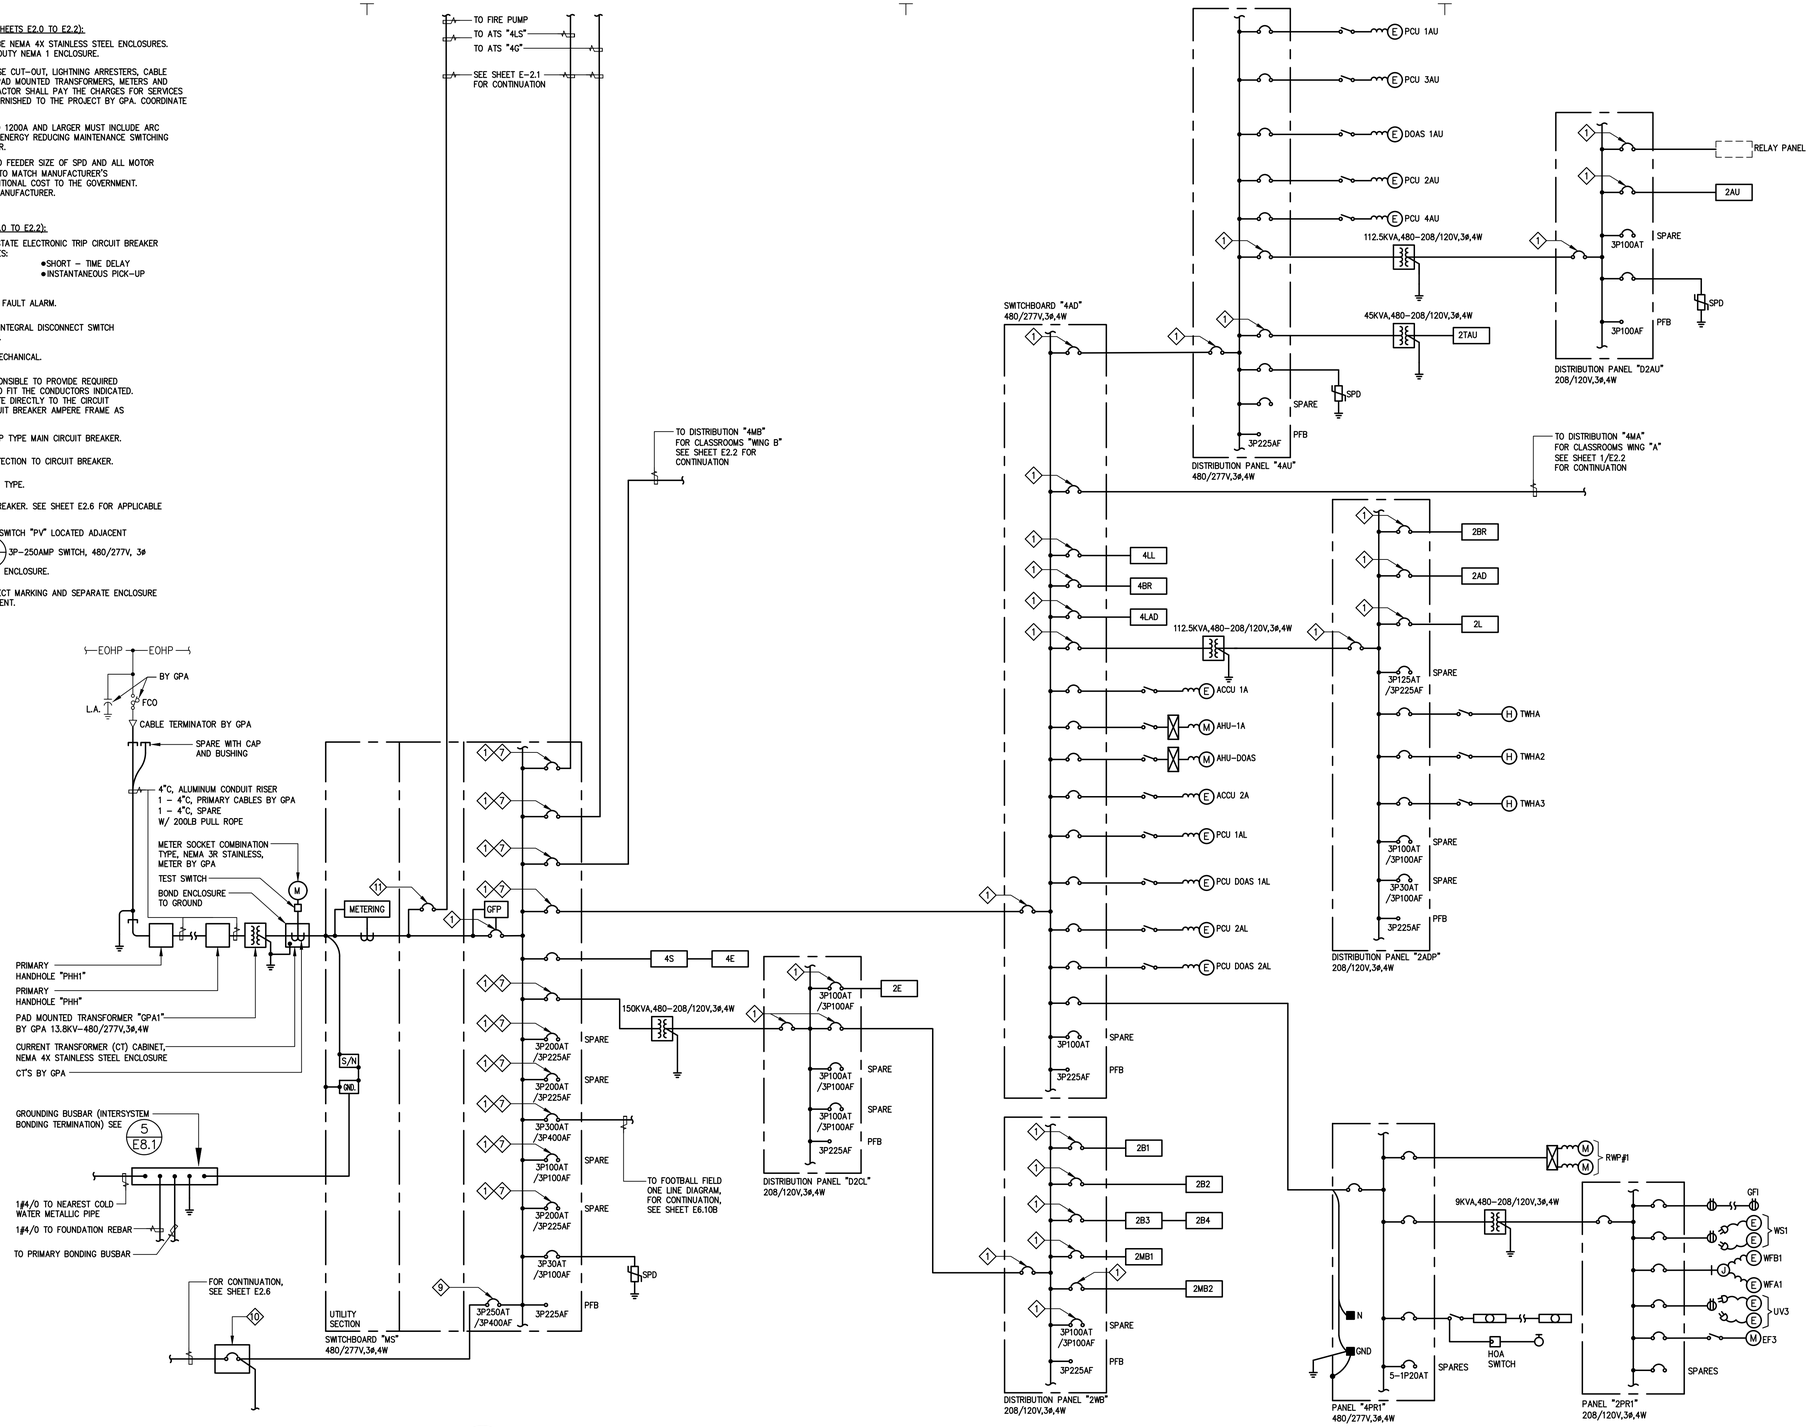
Drawing No. E1.4



Sheet No. ____ of ____

GENERAL NOTES (APPLICABLE TO SHEETS E2.0 TO E2.2):

1. EXTERIOR EQUIPMENT SHALL BE NEMA 4X STAINLESS STEEL ENCLOSURES. INTERIOR EQUIPMENT, HEAVY DUTY NEMA 1 ENCLOSURE.
2. CROSSARM, ACCESSORIES, FUSE CUT-OUT, LIGHTNING ARRESTERS, CABLE TERMINATORS, SPLICING KIT, PAD MOUNTED TRANSFORMERS, METERS AND TERMINATION BY GPA. CONTRACTOR SHALL PAY THE CHARGES FOR SERVICES RENDERED AND MATERIALS FURNISHED TO THE PROJECT BY GPA. COORDINATE WORK WITH GPA.
3. ALL CIRCUIT BREAKERS RATED 1200A AND LARGER MUST INCLUDE ARC ENERGY REDUCTION. PROVIDE ENERGY REDUCING MAINTENANCE SWITCHING WITH LOCAL STATUS INDICATOR.
4. ADJUST CIRCUIT BREAKER AND FEEDER SIZE OF SPD AND ALL MOTOR LOADS (HVAC, PUMPS, ETC.) TO MATCH MANUFACTURER'S RECOMMENDATION AT NO ADDITIONAL COST TO THE GOVERNMENT. VERIFY REQUIREMENTS WITH MANUFACTURER.

NOTES (APPLICABLE TO SHEETS E2.0 TO E2.2):

1. PROVIDE ADJUSTABLE SOLID STATE ELECTRONIC TRIP CIRCUIT BREAKER WITH THE FOLLOWING FEATURES:
   - LONG – TIME PICKUP
   - LONG – TIME DELAY
   - SHORT – TIME PICKUP
   - SHORT – TIME DELAY
   - INSTANTANEOUS PICK-UP
2. PROVIDE GENERATOR GROUND FAULT ALARM.
3. ELEVATOR CONTROLLER WITH INTEGRAL DISCONNECT SWITCH BY ELEVATOR MANUFACTURER.
4. STARTER, PROVIDED UNDER MECHANICAL.
